LETTER OF TRANSMITTAL.

DEPARTMENT OF THE INTERIOR,
CENSUS OFFICE,
Washington, D. C., April 1, 1884.

Hon. H. M. TELLER,
Secretary of the Interior.

SIR: I have the honor to transmit herewith the eighth volume of the quarto series comprising the final report on the Tenth Census. This volume, miscellaneous in character, contains a report (1) on the Newspaper and Periodical Press, by S. N. D. North; (2) on the Population, Industries, and Resources of Alaska, by Ivan Petroff; (3) on the Seal Islands of Alaska, by Henry W. Elliott; and (4) on the Ship-building Industry in the United States, by Henry Hall. The four subjects herein treated were confided to special agents, the results of whose investigations and studies are contained in these reports.

I have the honor to be, very respectfully, your obedient servant,

C. W. SEATON,
Superintendent of Census.

LETTER OF TRANSMITTAL

TO THE
COMMISSIONER OF THE
GENERAL LAND OFFICE
WASHINGTON, D. C.

I have the honor to acknowledge the receipt of your letter of the 10th inst. in relation to the above entitled matter. The same has been forwarded to the proper authorities for their consideration. I am, Sir, very respectfully,
Yours very truly,

LETTER OF TRANSMITTAL.

Hon. FRANCIS A. WALKER,
Superintendent of Census.

UTICA, N. Y., *October 1, 1881.*

SIR: I transmit herewith a Report upon the Newspaper and Periodical Press of the United States for the Tenth Census. The collection and preparation of the statistics of this branch of inquiry were intrusted to my care, as a special agent of the Census Office, on May 21, 1880. The report is divided into four parts, as follows:

- I. A history of the newspaper and periodical press from 1639 to 1880.
- II. Statistical tables.
- III. A catalogue of periodical publications issued during the census year.
- IV. A chronological history of the newspaper press of the United States.

The tables separately submitted are fifteen in number, and embody the essential facts and figures bearing upon the number, the character, the circulation, the earnings, the manufacture, and the comparative growth by census decades of the newspaper and periodical press. A number of minor tabular statements, illustrative of several of these features, are included in the body of the report.

The first portion of the report is an attempt to briefly sketch the history of newspaper and periodical publication in the United States, which was suggested by you as a proper complement to a report upon the present condition of this interesting industry. Private ventures in the direction of such a history have been few and unsatisfactory. The most important is Isaiah Thomas' *History of Printing*, which brings the subject down to the year 1810, covering in a very complete manner the history of printing in the United States up to that date. It was republished in 1875, with many valuable foot-notes and additions, by the American Antiquarian Society, of Worcester, Massachusetts, of which Mr. Thomas was the founder. *Journalism in the United States from 1690 to 1872*, by the late Frederic Hudson, of the New York *Herald*, preserves in desultory and unchronological form a great mass of important data relating to the subsequent development of the American press. In addition to the information supplied by these sources, much has been added from pamphlets, occasional addresses, scattered gazetteers, newspaper files, and personal correspondence. Notwithstanding the pains taken to complete the historical record, this portion of the work is at points incomplete and unsatisfactory; but care has been taken to supply all the statistics of any moment heretofore published respecting the publication of newspapers in the United States, and the groundwork here exists upon which hereafter may be constructed the full and complete history of the American press.

This history naturally divides itself into three periods, namely, the colonial, which carries the American newspaper to the close of the war of the revolution; the transitional, which brings the history down to that point of time when, by the perfection of printing machinery, the establishment of telegraphs and railroads, and the operation of other causes, the American press took on its present distinguishing characteristics, inaugurating the third period.

In considering the development of the press in this third era I have chosen to treat the historical data in direct association with the statistics elicited by the Tenth Census, and this consideration forms the third section of the report. The chronological method of treating such a topic is so unsatisfactory that it has been avoided, and in an appendix to the report has been gathered together, in chronological order, such data respecting the origin and growth of the press in each state and territory as was attainable.

The second portion of the report consists of a series of statistical tables.

LETTER OF TRANSMITTAL.

The third section of the report, being the catalogue of the American press in the census year, has been prepared directly from the schedules forwarded to the Census Office by the several publishers, and is submitted in the belief that it is valuable, not only for current reference, but as an historical record. A complete file of the newspaper and periodical press as it existed in the census year was also collected at your suggestion, arranged alphabetically by states and territories, and also by classes, and has been deposited in the Library of Congress, where it will be properly bound, and remain a unique memorial of the periodical literature of the census year.

It has not seemed fit, in a report of this character, to enter into any disquisition upon the character, the power, or the influence of the press as a factor in American civilization. The data for deductions of that nature are supplied for the use of others. Neither has it seemed proper to color an official report with allusions to the personal services of any of the distinguished gentlemen who have done so much in the past, and who are doing so much at present, to build up the press, to develop its resources, to extend its usefulness, and to elevate its general character and influence.

In conclusion, permit me to express the obligation I am personally under to yourself and the chiefs of the several divisions of the Census Office for unvarying courtesies and facilities during the progress of this investigation. Mr. Benjamin M. Lewis, of Utica, New York, who has served as assistant agent from the beginning of the investigation, is entitled to especial praise for the zeal, care, and intelligence with which he has forwarded the work. Acknowledgment is also due of the services of many private gentlemen, and especially to the corresponding secretaries of several historical societies, and to Dr. Henry A. Homes, the accomplished librarian of the New York state library, for valuable assistance in the collection of data.

Very respectfully, yours,

S. N. D. NORTH,
Special Agent.

THE NEWSPAPER AND PERIODICAL PRESS.

FIRST PERIOD: 1639-1783.

THE NEWSPAPER AND PERIODICAL PRESS OF THE UNITED STATES.

FIRST PERIOD.

INTRODUCTION OF PRINTING IN AMERICA.

The history of the United States of America is contemporaneous with the real development of the art of printing. The first known specimen of printing in the English language, the presumable handiwork of William Caxton, bears the date 1471, less than a quarter of a century before the discovery of America. The progress of the art in England and on the continent was quite as slow as the progress of discovery and settlement in America. The popular demand for the services of the printing press was not marked until after the publication at Antwerp in 1526 of Tyndale's translation of the Testament, and of Luther's Bible, which followed it, in 1534. There is positive evidence that a printing press was established in Mexico as early as 1540, (a) and John R. Bartlett alludes to the fact that "readers familiar with early books relating to Mexico have seen mention of a book printed there as early as 1535". (a) He continues that in the year 1532 the viceroy, D. Antonio de Mendoza, carried printing to Mexico. The first printer was Juan Pablos, and the first book printed in the New World was that written by St. John Climacus, entitled *Spiritual Ladder to Ascend to Heaven*. (b) He adds the titles of ninety-three books printed in Mexico prior to and including the year 1600, and of seven books printed in Peru before 1600. These books were mostly on religious subjects, the governments strictly prohibiting printing without license; but the list also includes many works which treat of history, morals, and classics, as well as grammars and dictionaries for the use of the aborigines. A royal printing house was established in Port au Prince, on the French part of the island of Santo Domingo, as early as 1650, and several other presses existed in neighboring towns at dates more recent, but previous to the eighteenth century. There was also printing in Portuguese America previous to the opening of the eighteenth century.

The development of printing contemporaneous with that of America.

Printing in Mexico.

Gazettes were also printed in both Mexico and Peru at a very early date; but whether anterior to the first New England newspapers is a matter of some doubt, although the probabilities favor that view. Several authorities state that they existed before the close of the seventeenth century. Dr. Robertson thus describes the contents of the *Gazetta de Mexico* for the years 1728, 1729, and 1730, printed in quarto:

Gazettes in Mexico and Peru.

It is filled almost entirely with accounts of religious functions, with descriptions of processions, consecrations of churches, beatifications of saints, festivals, *auto da fés*, etc. Civil or commercial affairs, and even the transactions of Europe, occupy but a small corner of this monthly magazine of intelligence. (c)

Even such a gazette, it should be added, was superior to anything published in the colonies until near the time of the revolution.

a Thomas' *History of Printing*, Appendix A. The references in this report are to the second edition of Isaiah Thomas' *History of Printing in America*, published in 1874 as volumes V and VI of the *Transactions and Collections of the American Antiquarian Society*, of Worcester, Massachusetts, under the joint editorial supervision of Samuel F. Haven, Nathaniel Paine, and Joel Munsell.

b *Ibid.*, vol. i, p. 367.

c In Spanish America the first newspaper was founded in Chili in 1712. * * * * In Mexico the oldest newspaper is *El Siglo XIX*, which is published daily, and supports liberal principles. * * * * In the present British-American colonies the credit of establishing the earliest newspaper belongs to the island of Barbadoes, where Keimer founded the *Barbadoes Gazette* in 1731. Thirty-one years afterward, in 1762, appeared the *Barbadoes Mercury*, which continued till 1845. In the other British West India islands newspapers were introduced as follows: Grenada, 1742; Antigua, 1748; St. Kitts, 1748; Dominica, 1765; St. Vincent, 1784. In July of the latter year the *Bermuda Gazette* was founded. In Canada the *Quebec Gazette* appeared in 1765, and the *Montreal Gazette* in 1775. In Nova Scotia the *Halifax Gazette* appeared in 1751, but was not firmly established till 1760. In New Brunswick two or three newspapers were published at St. John in 1782.—Appleton's *American Cyclopædia*.

The founders of the colony of Massachusetts arrived at Salem in 1628, and in January, 1639, the first printing was done in what is now the United States. (a) Previous to the establishment of this first press at Cambridge a number of manuscripts originating in the colonies had been sent to England for publication, and there is evidence that this practice continued for some eighty years afterward. (b) Moses

First press in Massachusetts.

Coit Tyler makes the first book written in America Captain John Smith's *True Relation of Such Occurrences as might have Happened in Virginia*, etc., which was composed in 1607 and published in London the following year. The second book written in the colonies was Smith's letter to the English proprietors, and the

First books written in the colonies.

third his *Map of the Bay and the Rivers*, which was not printed until 1612, at Oxford. In 1610 Sir Thomas Gates wrote *A True Repository of the Wrack and Redemption of Sir Thomas Gates*, which he sent to England to be printed. George Sandys, also of Virginia, wrote a translation of *Ovid*, which was sent to London for publication in 1626. There are records of a number of other volumes, chiefly of a religious character, which were written in this country and sent to England for publication prior to the establishment of the first press at Cambridge, in 1639. Thomas says in his *History of Printing in America* that "from a variety of causes it happened that many original works were sent from New England—Massachusetts in particular—to London to be printed. Among these causes the principal were: 1, the press at Cambridge had generally full employment; 2, the printing done there was executed in an inferior style; 3, many works on controverted points of religion were not allowed to be printed in this country".

As a matter of fact, up to this period, and for a long time after, there was almost no demand for printed matter in the colonies, and very few London publications of any character were sold in this country. The first regular bookseller of whom there is any account was Hezekiah Usher, who is not known to have been in business earlier than 1652. The British books that found their way to the colonies were generally kept in shops with other wares. Benedict Arnold sold drugs and books. Later in the development of the colonies the occupations of printer, bookbinder, and bookseller were generally combined in one.

Although there was considerable culture and learning among the early settlers of Virginia, and several of them were book writers, as we have seen, the feasibility of doing their own printing does not appear to have occurred to any one in the colony until 1681, seventy-four years after the first settlement was made. Some explanation of the delay clearly lies in the celebrated declaration of Sir William Berkeley, governor of the colony, in his answer to the inquiries of the Lords of the Committee for the Colonies in 1671:

I thank God we have not free schools nor printing, and I hope we shall not have these hundred years; for learning has brought disobedience and heresy and sects into the world, and printing has divulged them and libels against the government. God keep us from both.

The pious protest of the governor against "free schools and printing" nearly forty years after the founding of Harvard university and the establishment of the first printing press in the younger colony of Massachusetts has been held to illustrate the difference between the cavalier civilization of Virginia and the Puritan civilization of New England. When the first printing press was introduced into Virginia, in 1681, its adventuresome proprietor, one John Buckner, (c) was promptly called before the governor and council and ordered to enter into bond "not to print anything hereafter until his majesty's pleasure shall be known". This was an actual suppression of the press, and thus differed materially from the regulation of it by the appointment of licensers, which had in the meanwhile been sanctioned by law in Massachusetts. But it was simply the carrying out of royal instructions, and therefore

The licensing of printing in the colonies.

not a test of Virginia civilization. The licensing of printing was still in vogue in the mother country, nor was it formally abandoned there until 1694, on the accession of William and Mary. It continued, even after the revolution of 1688, to be assumed by the crown as one of the rights of the prerogative in all the American colonies, as claimed and exercised under the Stuarts. The royal governors

a The funds for the purchase of this press in England were contributed or collected by the Rev. Joseph Glover, a wealthy dissenting clergyman. The press appears to have been particularly provided for the benefit of the academy then founded there, and also for Harvard college, which was founded soon after. The records of the latter institution contain this entry: "Mr. Joss Glover gave to the college a font of printing letters, and some gentlemen of Amsterdam gave toward furnishing of a printing press with letters forty-nine pounds, and something more." Mr. Glover died on the voyage across the Atlantic in 1638, and the press was set up and managed for ten years by one Stephen Daye, who was employed by Mr. Glover in England to come to this country and serve in the capacity of a practical printer. The first press remained at Cambridge "upward of sixty years", and for about thirty years printing in the British North American colonies was exclusively conducted in this town. The first publication from this press was *The Freeman's Oath*, which bears the imprint 1639; the second was an almanac; and the third, printed in 1640, was *The Psalms in Metre, Faithfully Translated for the Use, Edification, and Comfort of the Saints in Publick and Private, especially in New England*, crown 8vo., 300 pages. Thomas gives a list of nine books or pamphlets known to have been published from this press while it continued under the management of Daye. He adds that "many others were printed by Daye, but no copies of them are now to be found".

b Thomas' *History of Printing*, vol. i, p. 15.

c *Ibid.*, vol. i, p. 331.

of the American colonies under William and Mary were vested with the censorship over the press. (a) The instructions to these governors read as follows, as quoted from the commission of a New York governor:

And forasmuch as great inconvenience may arise by the liberty of printing within our province of New York, you are to provide by all necessary orders that no person keep any press for printing, nor that any book, pamphlet, or other matters whatsoever be printed without your especial leave and license first obtained. (b)

Mr. Bancroft insists that, in spite of these instructions, "the press generally was as free in America as in any part of the world." To accept this view we must be convinced that the imposition of a license does not work a greater comparative repression in a country crude and unsettled, without expert mechanics, and with few ambitious of the printer's honors, where the art of printing has not yet obtained a footing, than in countries where, under even severer discipline, it had yet made steady headway for more than a century. At the same time it is to be borne in mind that the press sprang up in several of these colonies while these instructions were yet nominally in force, and in practical defiance of them. Yet, as long as the British authority remained unchallenged, there was continual interference with the press on the part of the government, and notably in the three colonies of Massachusetts, Pennsylvania, and New York, where it had taken hardest root. No single event in the colonial annals of the continent attracted more general attention, both in America and England, than the trial of John Peter Zenger, publisher of the *New York Gazette*, in 1735—thirty years later than the establishment of the first American newspaper—for the publication of "false, scandalous, malicious, seditious libels" against the royal government of the colony of New York; a trial in which the government persisted, by information, after the grand jury had refused to indict; a trial in which all the authority of the crown, all the weight of the court, and all the power of the English common law of libel failed to coerce a verdict of guilty from the jury. The trial of Zenger was the first real struggle of the colonial press for freedom of speech against the government, and laid the deep and broad foundation of the liberty of the press in America. But it was twenty years later (January 25, 1755) that the Rev. William Smith, first and last provost of the College of Pennsylvania, was arrested by order of the Pennsylvania assembly and sent to jail, where he remained six months, for translating and publishing in one of the German newspapers a pamphlet reflecting on the government. It was in 1771 that Thomas was annoyed by the Massachusetts governor and council very much as Zenger had been in New York, except that he was not imprisoned, and the attempt to proceed against him by information was abandoned on account of the popular opposition; and in 1769 General Alexander McDougall, of New York, reputed to be the author of a pamphlet, privately printed, which the assembly of that colony resolved to be a "false, seditious, and infamous libel on the government", was arrested, imprisoned from December to April, when the grand jury found an indictment against him, and was finally brought before the assembly and required to answer whether he was guilty or not. McDougall refused to answer, on the ground that he was under indictment for the alleged offense and was entitled to an unprejudiced trial before a jury of his peers. He was finally adjudged guilty of a breach of the privileges of the house, and committed again to prison, where he remained several months. The annals of the colonies are full of somewhat similar instances of the severity with which the authorities of this country, in imitation of those of Great Britain, dealt with the printers and those who participated in political discussion through the instrumentality of the newspaper or printed page.

The trial of Zenger.

The stamp act of 1765.

Colonial stamp acts.

The only direct legislation of Great Britain against the colonial press was the stamp act of 1765, aimed quite as much against other pursuits as against printing, but more direct in its influence upon the newspaper press than upon any other colonial enterprise. A considerable number of the newspapers, particularly in the south, were driven to suspend publication until the stamp act was repealed. More opulent but equally cautious publishers, when the act was to take effect, dressed their journals in mourning, and for a few weeks omitted to publish them. Others, less cautious, but apprehensive of the consequences of publishing newspapers without stamps, omitted the titles altogether, or altered them as an evasion. Those publishers who continued to print without reference to the stamp took a risk which proved how thoroughly imbued they were with the spirit out of which grew the revolution. The stamp act was but a temporary check to newspaper growth; but it must be regarded as the manifestation of a spirit which these early printers knew to be ever present, the spirit to coerce the press into more circumspect allusion to the causes of friction between the colonies and the mother country. The colonial governments in the colonies of Massachusetts and New York also resorted to stamp acts as a means of raising revenue. Such an act was passed in Massachusetts in 1755, and a similar act by the assembly of New York in 1756, which was continued until January, 1760. During this period the papers then published in that colony sometimes appeared with stamps and sometimes without them. These acts were plainly modeled upon the English parliamentary law, which then bore so heavily upon the press of the mother country. The fact that there were but two, and that they lasted so short a time, may be accepted as the evidence that the American colonists early recognized the press as an instrument of popular education and civilization, which was entitled to exemption from the burdens of taxation.

^a Bancroft's *History of the United States*, vol. ii, p. 279, edition of 1876.

^b *Documents relating to Colonial History of New York*. See Instructions to Governors Dongan, Sloughter, Fletcher, Bellomont, and Hunter, 1686 to 1709.

It is worthy of remark that since the revolution only two American states have attempted a direct tax upon the products of the press. In 1785 the legislature of Massachusetts passed an act imposing duties upon licensed vellum, parchment, and paper, and laid a duty of two-thirds of a penny upon newspapers and a penny upon almanacs, which were to be stamped. This act became at once so odious that it was repealed before it went into effect, but in the July following another act was passed which imposed a duty on all advertisements inserted in the newspapers of the commonwealth. This latter enactment was denounced by Isaiah Thomas, then publisher of the Worcester *Spy*, and by many of his contemporaries, as placing an improper restraint upon the press, and in consequence of it he discontinued the publication of the *Spy* during the two years in which it was in operation. One of the sources of revenue in the state of Virginia as recent as 1848 was a tax on newspapers, the revenue from which in that year amounted to \$355. (a)

MECHANICAL DIFFICULTIES ATTENDING THE INTRODUCTION OF PRINTING IN AMERICA.

It is difficult at this distance in time to realize the mechanical obstacles which retarded and embarrassed the introduction of printing in colonial America. Everything in the shape of materials was of necessity imported from the mother country, at an outlay which must be made at the risk of small and doubtful return. The earliest printing press known to have been manufactured in this country was made for Christopher Sower, jr., the Germantown printer, in 1750; but it was not until the eve of the revolutionary war that good printing presses were manufactured as a business in the colonies. In 1775 such presses were made in Hartford, Philadelphia, and elsewhere, modeled almost wholly on the English press; and after that date the importation of hand presses gradually ceased. Thomas says that the great improvements perfected by Adam Ramage in the prevailing press led to the entire cessation of importation as early as 1800; (b) but, as a matter of fact, the Ramage presses, while they were superior to anything previously built in this country, were wholly inadequate for satisfactory newspaper work, and his early presses were so small that only one-half of one side of a sheet of the ordinary dimensions of that period could be printed at one time, and four distinct impressions were necessary to print both sides of a small newspaper. (c) It was not until the beginning of the present century that iron was substituted for wood as the principal material in the construction of American presses. The most successful of these later inventions was the Columbian press, invented by George Clymer, of Philadelphia, about 1817, which certainly indicated the greatest improvement ever shown in one machine for hand printing, and many hundreds of which, with important later modifications, are still in use throughout the United States. Self-acting or machine printing presses were totally unknown before the present century; and, for many years after their invention and use in England, all that were used in this country were imported from Great Britain.

Paper was also of necessity wholly imported until 1700, and chiefly imported for nearly one hundred years thereafter. The first paper-mill in the colonies was built in 1690, by William Rittenhouse, at Germantown, Pennsylvania, with the assistance of William Bradford, then the only printer in the colonies southward or westward of New England. Ten years later this little mill was carried away by a freshet, and the stone mill, erected in its stead soon after, continued to manufacture paper until 1798, under the auspices of the same family. How far in the enterprise of paper-making William Bradford was in advance of the country generally may be inferred from the fact that the first paper-mill in New England—a region which was settled by the English a half century before Pennsylvania—to wit, that at Milton, Massachusetts, was not erected until 1730, about forty years after the one in Pennsylvania. (d) The whole history of this first paper-mill has been carefully collected by Horatio Gates Jones in his *Historical Sketch of the Rittenhouse Paper Mill*. In 1770, according to Munsell, (e) there were forty paper-mills in New Jersey, Pennsylvania, and Delaware, which were supposed to make £100,000 worth of paper annually. At the breaking out of the revolution there were three small paper-mills in Massachusetts, and one in Rhode Island out of repair. (f) The paper these mills could make fell far short of the demand, and much of it was miserably manufactured, it being often taken from the mills wet and unsized. Rags were scarce, and were collected and transported with great difficulty. The manufacture of paper was further checked by the great difficulty of finding skilled workmen to carry it on. The paper-makers, like the printers, were long in increasing, because the uncertainties attending the business were so great as to deter men from undertaking it, either as a trade or with a view to the investment of capital.

Still more important, as a repressive influence, was the cost and difficulty of securing type for printing enterprises. It was not until 1772 that a regular type foundry was established in America, although there had been at least two previous unsuccessful efforts in that direction—one in Boston, about 1768, by a Mr. Michelson, from Scotland, and one in Connecticut, a few years later, by Abel Buell. g I have yet to notice an exceedingly interesting fact in regard to the history of newspapers and printing in Connecticut—a fact which seems not to be widely known. It is, that the first metallic type cast on this continent was the work of an ingenious citizen of this

Christopher Sower, jr., already mentioned as the first manufacturer of a printing press in America, established a type foundry at Germantown in 1772. This was eighty-four years after the first venture of the father, on the same spot, in the manufacture of paper. The materials for this foundry were imported from Germany, as well as a workman to make use of them. The first font cast here was a German pica for the printing of a Bible, a fact significant in more ways than one. About the time the revolution broke out a second type foundry was established at Germantown by one Jacob Bey, who had been a workman in the original American foundry. The type foundry established by Benjamin Franklin in 1775 was the third in the colonies, and the last until the close of the revolutionary war. It was under the management of B. F. Bache, Franklin's son-in-law, and was equipped with all the materials needed for making Greek, Hebrew, or Roman type; but the small demand for types led to its practical abandonment before it contributed substantially to the supply of types in the country at the time the revolutionary war was in progress. It was a number of years after the conclusion of that war before the United States was able, from its own manufactories, to supply the better part of the increasing demand for types. (a)

The printing ink used in this country for many years was almost wholly imported from Europe. Thomas records that Rogers & Fowle, of Boston, who were engaged in the book and newspaper printing business in 1750, were the only printers in the colonies who at that time could make good ink. He adds that "in the first stages of printing printers made their own ink and types; but the manufacture of types and ink soon became separate branches of business. Most of the bad printing in the United States, particularly in New England, during the revolutionary war was occasioned by the wretched ink and more wretched paper which printers were then under the necessity of using". (b)

These were the mechanical and material obstacles in the pathway of the rapid introduction of the art of printing in the American colonies. They were of a character to check and restrain a movement in that direction, which during the entire century previous to the American revolution had been undergoing remarkable acceleration in Great Britain. The people of that country were just beginning in this century to discover the possibilities and the capabilities of the printing press. Books were multiplying, periodical publications were becoming an accepted element in the current civilization, and the masses of the people were beginning to get the benefits of the art that has done more than all other arts to level and destroy the distinctions of class and caste.

SMALL DEMAND FOR BOOKS AND NEWSPAPERS.

It is an accepted fact that the development of printing in England and on the continent during the three-quarters of a century preceding the American revolution was marvelous in degree and in kind, notwithstanding repressive and increasing government taxation, and found no counterpart on this side of the ocean. The purely mechanical obstacles which have been summarized were the least important causes of this slow progress. They were obstacles which the inventive enterprise of the colonists would have overcome if the effort in that direction had been stimulated by the promise of adequate reward, but

(Middlesex) county; I mean Abel Buell, of Killingworth. He petitioned the general assembly in 1769 for aid to establish a foundry, for the reason that he had discovered the art of letter founding, which he said in his Memorial was known but to few in Europe. He asked for assistance, "either by lottery or in some other way." He added that, as a specimen of his abilities, he had caused his Memorial to the general assembly to be impressed with types of his own manufacture. This document, thus impressed, may be seen in the state library at Hartford. It is a very excellent specimen of typography, and but little inferior to the best of the present day.

A committee of the assembly took the subject into consideration, and reported, in regard to Buell's invention, that they "are fully convinced that he hath discovered the art of letter founding". They proposed to let him have £100, "provided he doth not depart from this colony to inhabit elsewhere." Buell was required to give bonds in the sum of £200 that he would return the money loaned by the general assembly after the lapse of seven years.

It does not appear, however, that the foundry was ever erected. In the Yale college library, in connection with this subject, are letters from Benjamin Yale, of Killingworth, of the date of Buell's petition to the legislature, addressed to President Stiles, the head of the college. Yale solicits the assistance of President Stiles in behalf of Buell, for the reason that he has "done a great thing for his country in learning the art of compounding type metal and casting type". He cautions that literary functionary not to let the secret communicated be known or hinted. He adds: "If you want to have a set of types, you must either procure him some old types—or if you could get a pound or two of bismuth—I think all the metals of which types are composed are to be had in America, unless it be bismuth, and I very much suspect that is likewise." He also informs President Stiles that there were at the time (1769) "near 40 presses in America; that a set of types cost £300 sterling, and they do not last more than seven or eight years. The saving to America [he continues] will be considerable annually".—Address delivered before the Connecticut Editorial Association, June 20, 1855, by James F. Babcock, of the New Haven *Palladium*.

a David Bruce, in a history of type founding in the United States, says:

The history of type founding as a business dates no farther back in this country than 1798, strictly speaking. It is true the introduction of various parcels and portions of type-founding implements dates almost coeval with the introduction of the earliest printing establishment, simply for the purpose of supplying sorts to particular offices; but type founding, as a self-sustaining business, did not exist in this country prior to the date above given, when Messrs. Binney & Ronaldson established themselves successfully in Philadelphia. Their struggle for existence in the then limited condition of printing in the United States was indeed very severe, and had not the state of Pennsylvania generously donated them the sum of \$5,000 it is doubtful if they could have survived the difficulties they encountered.

b The paper and ink used by John Foster, "the first printer of London" (as he is designated on the stone which marks his grave in the Dorchester burying-ground), have stood the test of time much better than the materials used by our printers a century later. Some of his election sermons may be called elegant specimens of printing. Like impressions would do no discredit to our best printing concerns.—Munsell.

that promise was altogether lacking. The colonists were not a reading people. Franklin bears striking testimony to this fact in his autobiography:

At the time [he writes] I established myself in Philadelphia—1723—there was not a good bookseller's shop in any of the colonies to the southward of Boston. In New York and Philadelphia the printers were indeed stationers, but they sold only paper, almanacs, ballads, and a few common school-books. Those who loved reading were obliged to send for their books to England.

They were far removed from the incentives and the influences which contributed to make a demand for books and newspapers in a thickly and thoroughly settled country like England, and they were not only isolated, but they had a greater concern and interest in what was going on in the mother country than in the affairs of a neighboring colony. Thus it happened that long after the making of books had begun in the colonies those few among the settlers who cared at all for books continued to prefer the volumes manufactured in England and sent across the seas, at prices at least as reasonable as those for which the American printers could afford to vend the products of their presses.

It was with newspapers as with books. Those who cared for them at all preferred the sheets which came across the water, and were wholly taken up with the details of English and European politics. The early American newspapers, exhibiting that instinct which judges so accurately of the wants of the masses, and is to-day a striking characteristic of the newspaper publisher of the United States, were almost wholly filled with the details of foreign happenings. The people of one colony heard from England with greater frequency, and generally with greater interest, than they heard from another colony. We need no further explanation than is conveyed by these facts of the constant complaints of the early New England editors that their efforts to supply the colonists with the latest news were rewarded by the failure to receive in return the money expended to that end. The circulation of an American-made book, pamphlet, or newspaper was necessarily limited almost wholly to the town in which it was published. Mails were infrequent and irregular; communities were widely separated as well as sparsely settled; and to venture into the printing business under such circumstances was to be a devotee or a fanatic, and there were not many such among the men and women who laid the foundations of the American republic. The scarcity of practical printers among the colonists has attracted the attention of historians. Those who knew the trade had learned it in England, and for years after printing presses were introduced it continued to be necessary to send across the waters for printers to man them. When Governor Fletcher tempted Bradford to New York, in 1693, he did it because he could find no printer in all that city, *(a)* and there were several instances in which rewards were offered to tempt printers into the southern colonies.

THE FIRST STIMULUS TO PRINTING IN AMERICA.

As the questions out of which the revolution sprang began to engross the attention of the colonists the conditions we have related underwent a rapid and complete revolution. It came to be seen that the several colonies had a common cause, and that the fate of that cause transcended in interest and importance anything that might happen on the other side of the water; that the press was a most valuable and indispensable auxiliary of this common cause, and that it was the instrument most potential to secure unity of opinion and concert of action among the colonists. Men not printers, and not identified with the business in any way, were brought into closest relations with the press by this political excitement, and printing thus had the advantage of an artificial stimulus during the years preceding the outbreak of the revolution, patriotism taking the place of profit as an incentive to new enterprises.

The American people had just begun to realize the significance and importance of the press as the revolution broke upon them. They found themselves at war with the country upon which they had relied for everything in the shape of printed matter and printing materials, with no adequate provision for supplying themselves with the instrumentalities for producing their own printed matter. The specimens of the art which came from the colonial presses during the continuance of the war gave abundant evidence of the primitive appliances and the crude and unskillful workmanship. But the revolution was of incalculable service to the art in this country in two ways. It educated a generation of readers, and it evolved a generation of mechanics ready to supply those readers and quite as skillful as any of their English rivals in the invention of improved processes and the execution of good work. For a long period after the termination of the revolutionary struggle the lot of the American printer, in whatever department it was cast, was not an easy one. Those who could afford to buy books in any quantity still preferred the book of English manufacture, and venture after venture in the making of books of a higher grade than ordinary met with disastrous failure. The constituencies of the few newspapers which proved their right to live, by surviving the cruel ordeal of the war, continued to be small and unresponsive, and the utility of the periodical press as a medium for advertising had not yet been discovered.

Gradual change in the position of the press.

Effect of the revolution upon American printing.

a The following entry appears on the council minutes of the province of New York:
Resolved in Council, That if a Printer will come and settle in the city of New York for the printing of our acts of Assembly and Publick Papers, he shall be allowed the sum of £40, current money of New York, per annum for his salary, and have the benefit of his printing besides what serves the publick.
 March 23, 1693.—Council minutes, vi, 182.
 Arriving in New York, Bradford was immediately appointed royal printer.

The prices paid for paper and printing material continued to be ruinously high, and men who had passed the better part of their lives in the business were compelled to confess that the result was complete failure in the pecuniary sense, and that it had been a life of hard work, constant anxiety, unnumbered embarrassments, and scant rewards. Of course there were occasional exceptions. In his autobiography, Benjamin Franklin, discussing the circumstances which induced him to establish a new newspaper in Philadelphia, speaks of the only journal then existing in that city, which was Andrew Bradford's, as "a paltry thing, wretchedly managed, and yet profitable to him". The well-known antipathy between the two great Pennsylvania printers must be remembered in considering the import of this criticism. The fact that Bradford had found the printing business profitable is established. Franklin speaks of him later on as "rich and easy, and caring little for the business". He undoubtedly made the greater portion of his money out of the general printing business rather than out of the newspaper. Franklin himself, notwithstanding the adverse circumstances under which he began the business for himself in Philadelphia, by rigid economy and indomitable industry very soon succeeded in paying for his establishment and amassing a fairly comfortable competence. But even Franklin turned very early from the exclusive attention to his printing office to supplement his earnings by the office of clerk of the colonial legislature, and later by that of postmaster. These and some other exceptions to the general rule do not alter the truth of the statement that the occupation was one of hardship and penury, "the business of the printer," to quote from Franklin's autobiography again, "being generally regarded as a poor one."

THE RELIGIOUS AND THE POLITICAL PAMPHLET.

The characteristic literature of the early colonial period, indeed, was neither the book nor the periodical, but that intermediary form known as the pamphlet. The pamphlet form was still a popular though no longer a prevailing method of publication in England, and it was natural, in a new and rude country, for the literature to take this fragmentary and transient shape. The colonists were not equal to Colonial pamphlet literature. book writing or book making, and they had no need for newspapers. Their demands upon the printing press were few, and were made at distant intervals for the most practical of purposes. Thus, while the pamphlet met their wants and constituted the bulk of their literature, its most common appearance at the beginning was in the shape of the almanac. The second issue from the first Cambridge press was an almanac, and there are more almanacs than all other classes of pamphlets combined, excepting only sermons, in the bibliography of colonial literature. Some of these almanacs met with enormous sales for that day, sixty thousand copies of Ames' famous almanac, printed by John Draper, being annually sold in the New England colonies. (a)

The bibliography of the epoch (b) reveals the fact that the great bulk of the publications of the early printing presses, other than almanacs, were in pamphlet form; that is to say, they were rude, unbound publications, of less than one hundred pages each, generally not more than twenty-five to fifty, and they arrange themselves into two grand groups—the religious and the political tract or pamphlet. In the earlier days of colonial settlement the religious pamphlet naturally predominated; it was in line with the prevailing tendencies of the colonial mind, and consisted of the publication of a famous sermon or a contribution to some of the many prevailing religious controversies, an exhortation to severer living, a denunciation of some prevalent vice, or a tract or waif sent out upon its proselyting mission. There exists a list (c) of three hundred and eighty-two of the publications of Cotton Mather (believed to be far from complete), nearly all of which were single sermons, controversial letters, or tracts of a theological complexion. The list of the publications of Increase Mather includes eighty-five titles, principally sermons or similar tracts. The fecundity of these celebrated divines was exceptional, but the direction of their efforts was not exceptional.

As the colonies progressed toward their political destiny the religious pamphlet, while it continued important, was relegated to the secondary position, and the tract became the most common method of intercommunication among the men who were profoundly concerned in the problem of the political destiny of the American colonies. These tracts or pamphlets usually took the form of letters, and were signed by fictitious names. They formed, indeed, the great bulk of the colonial literature immediately preceding the revolution, and are almost the only feature of it which is worthy of recognition as forming a distinctive colonial literature. Miscellaneous writing continued to be either a faint reflection of the cultivation of the old world or nondescript in its character and utterly unworthy

^a Thomas, i, 126.

^b The second edition of Thomas' *History of Printing in America* contains in an appendix a catalogue of publications prior to the revolution in what is now the United States. There are in the list 7,683 entries of titles, of which number nine-tenths, at least, are of pamphlet or tract publications. This catalogue was the work of Dr. Samuel F. Haven, jr., of Worcester, Massachusetts, one of America's most accomplished antiquarians. The work of compiling this catalogue of titles, starting from the basis of memoranda left by Isaiah Thomas, was not completed at the time when Dr. Haven dropped his antiquarian work in response to the call of his country, in whose cause he sacrificed his life. The editors of the second edition of Thomas' *History* published the catalogue just as Dr. Haven had left it. Thus it happens that the late Joseph Sabin, in his *Bibliography of American Bibliography*, describes this list of ante-revolutionary publications as being "far from complete", and adds, with truth, that "a reference to Sabin's *Dictionary of Books relating to America* would have furnished many titles now entirely omitted". Careful comparison of the entries in this list and in Sabin's *Dictionary* reveals several hundred titles omitted in the former. As a rule, they are of the tract or pamphlet order, and of unpretentious character.

^c *Life of Cotton Mather*, by his son, Samuel Mather. Boston, 1729.

in its attempts at originality, a conclusion to be drawn after considering the industrious efforts of Moses Coit Tyler to rescue early American literature from oblivion and elevate it to permanent dignity. (a) The type of fragmentary literature represented by the political pamphlet was not only developed out of all proportion to every other form of literature except the religious in colonial America, but exhibits in its best aspects the tendencies and peculiarities of the American mind, and at the time took immediate rank with the cultured writing of European statesmanship. This was before an American book, outside of politics, had ever been read or heard of on the other side of the Atlantic. (b)

The pamphlet era of colonial literature has been spoken of as the formative one. This form of publication was not chosen for the reason that it was the best, but because it was the only form available. As the newspaper developed in importance the pamphlet slowly but surely made way before its onward march. The burden of the publication of the pamphlet rested solely upon the author, and he could not, and did not, look for reimbursement by sales. Its circulation was correspondingly limited, and it was, moreover, necessarily accidental, as it was without organized and regular methods of reaching the hands of those to whom it was addressed. These methods the newspapers at once supplied, and the amalgamation of the political pamphlet and the newspaper became speedily complete, adding to the importance of each. They gave publicity to the views of the political writers of the time without involving either them or the newspaper publishers in expense on account of them, and came in time to be an expected and a distinguishing feature of the periodical press. The latter crowded the pamphlet out of the field, and has held its own against it ever since, as it is right and natural that it should. Undoubtedly the pamphlet, with its popularity, stimulated the printing industry of the colonial epoch, and was a great instrumentality in preparing the way for the more rapid establishment of newspapers. As the colonies approached the verge of the revolution the number of political writers increased rapidly, but their writings found circulation almost entirely through the medium of the periodical press.

THE FIRST NEWSPAPERS.

The first English newspaper printed in America was issued from a Boston press in 1690. It is a significant commentary upon the subsequent rank growth of periodical literature in the United States that this pioneer paper was immediately suppressed by the authorities of Massachusetts. It was entitled *Publick Occurrences*. *Publick Occurrences, both Foreign and Domestick*, and, for the reasons named, never reached the dignity of a second number. (c) It is doubtful, therefore, whether the real date of the birth of American journalism is not fourteen years later, as given by Thomas, because of the establishment of the Boston *News-Letter* on April 4, 1704. (d) It is worthy of attention that it was during the series of years in which the printing press was gradually getting foothold in the American colonies that the determined and finally successful effort to

a *A History of American Literature*, 2 vols., 1676-1765. By Moses Coit Tyler: 1879.

b In the early schools of the colonies the American mind was soon educated to a point in the science of politics much in advance of the contemporary culture of Europe, and it produced, along with this intellectual progress, a literature the vigor and even sometime elegance of which became the admiration of some of the first publicists and statesmen of England. Of course the remains of this early literature are very scant. Before the revolution of 1776 few books were printed in America, and most of the school-books came from England. The political literature of the colonial era was necessarily or conveniently tractarian, taking the form of pamphlets and letters and other comparatively light and perishable forms of the press; yet many of them were perishable only in the conventional sense, and the controversial pamphlets of colonial politics, the prints of Franklin and Witherspoon and Price, the tracts of Adams, the *Farmer's Letters* of Dickinson, and the *Common Sense* of Paine take rank with a literature that in more modern times has been thought worthy of preservation in the best boards of the binder's art, and illuminates the libraries of our scholars. It would be interesting to collect these productions of the colonial period, in a sense more extraordinary than that of reclaiming strays and fugitives in the general literature of our country. The form of literature, so far as print and paper are concerned, is very insignificant, and in some sense the distinction between the pamphlet and book is merely mechanical; yet this minor literature (using the comparative term as only that of the printer's art) attaches some peculiarities which give it frequently a character *sui generis*. This is remarkably so in one form of literature even lesser, mechanically, than the pamphlet, and one which was formerly much in fashion in our politics. The modern facilities of the press and the multiplication of its uses have been the occasion of the decay of what at one time figured largely in the communication of ideas, and especially those concerning political affairs. We refer to the elaborate letter, or epistle, in times wherein the means of miscellaneous print were less abundant and men were wont to compose long dissertations in communications to their friends, designed, perhaps, to go the rounds of a circle of acquaintances. * * * Beyond the letters of Franklin but little has been rescued from what was almost the exclusive department of our literature in colonial times. Much of it must have been destroyed in the perishable form of manuscript, or has passed beyond the region of discovery. * * * It is to be observed that America has reversed that order which has commonly been observed in the productions of a nation's genius. As a general rule of history, the poet precedes the statesman, or, in more general phrase, the arts are anterior to political science. This rule we see remarkably reversed in the intellectual development of America.—Tyler's *History of American Literature*.

c Considerable doubt has been expressed regarding the genuineness of the only copy of this paper known to be in existence, which is in the State Paper office in London. That such a paper was actually published at the date given would seem to be established beyond peradventure by the references to it in the colonial annals of Massachusetts.

d The second newspaper printed in the colonies was a republication of an English gazette in 1696 in New York by order of the royal governor. The circumstance is thus detailed by Governor Fletcher in a letter to the lords of trade, dated May 30, 1696: "A ship belonging to this place from Madera happily met at sea that vessel which had your Lord's packet for Virginia, & brought me a Gazette which gave me an account of that horrid conspiracy against His Majesty's Sacred person. I caused it to be reprinted here, & proclamation was issued for thanksgiving thro'out the province."—*Documentary History of New York*, iv, 150.

secure the abolition of the censorship of the press was in progress in the mother country. (a) The general system of censorship was established in England by a decree of the star chamber, dated June 11, 1637, which remained in force during the civil war, and was confirmed by act of parliament in 1643. Censorship of the press. It was against this act that Milton wrote his *Areopagitica, a Speech for the Liberty of Unlicensed Printing*. The act expired in 1679, and thereafter any person might print, at his own risk, a history, a sermon, or a poem without the previous approbation of any public officer. But the courts continued to hold that this liberty did not extend to gazettes, and that by the common law of England no man not authorized by the crown had a right to publish political news. This view of the common law was accepted without dispute in the colony of Massachusetts. Four days after the appearance of the *Publick Occurrences* it was spoken of in the general court as a pamphlet which came out "contrary to law, and contained reflections of a very high nature", (b) and it thereupon strictly forbade "anything in print without license first obtained from those appointed by the government to grant the same". (c) This short-lived pioneer of the American press was published by Benjamin Harris "at the London coffee-house", and was printed for him by Richard Pierce on three pages of a folded sheet, one page being blank, two columns to a page, and each page being 7 by 11 inches. It was intended to appear monthly, and the journalistic notions of its projector were fully set forth in the following prospectus:

It is designed that the Countrey shall be furnished once a month (or if any Glut of Occurrences happen, oftener) with an account of such considerable things as have arrived unto our Notice. In order hereunto, the Publisher will take what pains he can to obtain a Faithful Relation of all such things; and will particularly make himself beholden to such Persons in Boston whom he knows to have been for their own use the diligent Observers of such matters. That which is herein proposed is, First, That Memorable Occurrences of Divine Providence may not be neglected or forgotten, as they too often are. Secondly, That people everywhere may better understand the Circumstances of Publique Affairs, both abroad and at home; which may not only direct their Thoughts at all times, but at some times also to assist their Business and Negotiations. Thirdly, That some thing may be done toward the Curing, or at least the Charming of that Spirit of Lying, which prevails among us, wherefore nothing shall be entered, but what we have reason to believe is true, repairing to the best fountains for our Information. And when there appears any material mistake in any thing that is collected, it shall be corrected in the next. Moreover, the Publisher of these Occurrences is willing to engage, that whereas, there are many False Reports, maliciously made, and spread among us, if any well minded person will

Prospectus of the
"Publick Occurrences"

a The newspaper press cannot be said to have had an existence in England until the expiration of the law which subjected the press to a censorship, May 3, 1695. Within a fortnight Harris announced that the *Intelligence, Domestic and Foreign*, suppressed fourteen years before by tyranny, would again appear. Ten days later was printed the first number of the *English Courant*. Then came the *Packet Boat* from Holland and Flanders, the *Pegasus*, the *London Newsletter*, the *London Post*, the *Flying Post*, the *Old Postmaster*, the *Postboy*, and the *Postman*. These first English newspapers were not superior typographically to their humble imitators across the Atlantic, and hardly superior in a literary point of view. On these points Lord Macaulay says in his *History of England*: "At first these newspapers were small and mean-looking. Even the *Postboy* and the *Postman*, which seem to have been the best conducted and the most prosperous, were wretchedly printed on scraps of dingy paper, such as would not now be thought good enough for street ballads. Only two numbers came out in a week, and a number contained little more matter than may be found in a single column of a daily paper of our time. What is now called a leading article seldom appeared, except when there was a scarcity of intelligence, when the Dutch mails were detained by the west wind, when the Rapparees were quiet in the Bog of Allen, when no stage-coach had been stopped by highwaymen, when no nonjuring congregation had been dispersed by constables, when no ambassador had made his entry with a long train of coaches and six, when no lord or poet had been buried in the Abbey, and when, consequently, it was difficult to fill up two pages. Yet the leading articles, though inserted, as it should seem, only in the absence of more attractive matter, are by no means contemptibly written."

b Buckingham's *Reminiscences*.

c In 1662 some religious pamphlets were published by the colony, which the general court or some of the ruling clergy judged rather too liberal and tending to open the doors of heresy, and regular licensers of the press were therefore appointed at that time. The ancient records of the colony show that Major Daniel Gookin and the Rev. Jonathan Mitchell were the first appointees under this regulation. A year later, May 27, 1663, the regulation was rescinded and the general court "ordered that the printing presse be at liberty, as formerly, until this court shall take further order, and the late order is hereby repealed". The effect of this repeal seems to have been a return to the publication of somewhat free-spoken pamphlets. The government immediately became alarmed again, and the following rigid edict was subsequently passed:

At a General Court called by order from the Governour, Deputy Governour, and other magistrates, held at Boston 19th of October, 1664. For the preventing of Irregularities and abuse to the authority of this Country, by the Printing Presse, it is ordered by this Court and the authority thereof, that theire shall no Printing Presse be allowed in any Towne within this Jurisdiction, but in Cambridge, nor shall any person or persons presume to print any Copie but by the allowance first had and obtained under the hands of such as this court shall from tyme to tyme Impower; the President of the Colledge, Mr. John Shearman, Mr. Jonathan Mitchell and Thomas Shephard, or any two of them to survey such Copie or Coppies and to prohibit or allow the same according to this order; and in case of non-observance of this order, to forfeit the Presse to the Country and be disabled from Vsing any such profession within this Jurisdiction for the tyme to Come. Provided this order shall not extend to the obstruction of any Coppies which this Court shall Judge meete to order to be published in Print.

At the same time a law was passed that "no printing should be allowed in any town within its jurisdiction except in Cambridge". This was subsequently so modified as to permit the use of a press at Boston, and a person authorized to conduct it.

The government not only required conformity to this law, but even exercised a power behind and above it, as on an occasion when the licensers had permitted the republication of a book written by Thomas á Kempis, entitled *Imitation of Christ*, etc. This treatise was presented to the court in the session of 1667 as heretical, and immediately the following order was passed: "This court being informed that there is now in the presse reprinting a book that imitates of Christ, or to that purpose, written by Thomas Kempis, a popish minister, wherein is contained some things that are lesse safe to be infused amongst the people of this place, Doe comend to the licensers of the presse the more full revisale thereof, and that in the meane tyme there be no further progresse in that work."

Daniel Fowle, one of the best printers and the best known men in New England in that time, was arrested in 1754, on an order from the house of representatives, and taken before that body, on suspicion of having printed a pamphlet entitled *The Monster of Ministers*, by Tom Thumb, Jr., which reflected on some of its members.

be at the pains to trace any such false Report, so far as to find out and Convict the First Raiser of it, he will in this Paper (unless just Advice be given to the contrary) expose the Name of such person, as A malicious Raiser of a False Report. It is supposed that none will dislike this Proposal, but such as intend to be guilty of so villanous a Crime.

Harris is spoken of by Thomas as the fifth printer in Boston, and previous to and after his journalistic venture he was engaged in printing, chiefly for the booksellers. Two years after the suppression of his *Publick Occurrances* he was appointed by Governor Phipps "Printer to his Excellency the Governor and Council", and printed the acts and laws of Massachusetts in 1692 and 1694.

There was nothing significant about this first journalistic venture, except the manner of its sudden demise. It was an enterprise conceived by a printer lately from London, and modeled after the sheets which were at that time beginning to be of comparative frequency in the British capital.

The second American journal appeared April 24, 1704; it was printed by Bartholomew Green, (a) and published and edited by John Campbell, then postmaster of Boston. It was called the "*Boston News-Letter*, published by authority", and was issued every Monday. Its beginning was nearly contemporaneous with the appearance of the first Scottish gazette, and it appears to have been the natural outgrowth of a series of news-letters (modeled after the similar letters that had long previously been sent regularly from London into the provinces), which Campbell, by virtue of his official character as postmaster, had been in the habit of preparing and sending to the governors of the several New England provinces. Nine of these letters have been preserved. (b) They embody, in concise form, a digest of the most recent news received from across the water and the events in Massachusetts bay, with occasional political or other suggestions; and they doubtless conveyed the first intelligence of these events to the distant points whither they were sent. It was a function which a postmaster, as a center of intelligence, naturally assumed; and it is not surprising that, for a long period after John Campbell established his *News-Letter*, a newspaper was regarded as a natural adjunct of a post-office. (c) The second paper in the colony was established in 1719 by William Brooker, immediately upon his appointment to succeed Campbell as postmaster of Boston, and was called the *Boston Gazette*. Four postmasters in succession conducted the *Gazette*, and the post-office may fairly be called the godfather of American journalism. (d) Beside the *News-Letter* and the *Gazette*, established by postmasters, the *Boston Weekly Post Boy* was founded, in opposition to the *Gazette*, by Ellis Hushe, immediately upon his being appointed postmaster in 1734. James Parker, postmaster of New Haven, established the *Gazette* in 1755, and Benjamin Mecom, postmaster, published the same journal in 1764. The *Providence Gazette* was established by John Carter, who had been postmaster before the revolution. James Parker, the founder of the *New York Gazette and Weekly Post Boy* (1742), was comptroller of the post-office, and was subsequently accused by William Weyman, who had been his partner, and who began a rival *Gazette* in 1759, of giving orders to post-riders not to circulate this new journal. William Hunter, the publisher of the *Virginia Gazette*, was also the postmaster. During a considerable portion of the period in which he conducted the *Philadelphia American Weekly Mercury* Andrew Bradford was postmaster of that city; and the office was indeed, if we can accept Franklin's statement, "an important adjunct of the newspaper. As he held the post-office, it was imagined that he had better opportunities for obtaining the news, and his paper was thought a better distributor of advertisements than mine, and therefore had many more; which was a profitable thing for him and a disadvantage to me, for tho' I did receive and send papers by the post, yet the public opinion was otherwise; for what I did send was by bribing the riders, who took them privately, Bradford being unkind enough to forbid it, which occasioned some resentment on my part; and I thought so meanly of the practice that when I afterwards came into the position I took care never to imitate it."

a Five days after town meeting was issued in Boston the first newspaper published in North America. This was the *Boston News-Letter*. The proprietor and publisher was John Campbell. He was postmaster of Boston, and this office gave him superior facilities for the circulation of a newspaper. Nicholas Boone was associated as publisher.—Samuel G. Drake's *History of Boston*.

The first newspaper established in North America was the *Boston News-Letter*, the first number of which appeared on Monday, April 24, 1704. The contents of the *News-Letter* during the whole of Campbell's proprietorship are chiefly extracts from the London papers. The little that has the appearance of having been written by the editor is clumsily composed, with no regard to punctuation or grammatical construction. The *News-Letter* was regularly published for nearly seventy-two years.—Buckingham's *Reminiscences*, vol. i.

The prospectus of the *News-Letter*, as printed in the first issue, was as follows:

ADVERTISEMENT.

This News-Letter is to be continued weekly, and all persons who have Houses, Lands, Tenements, Farms, Ships, Vessels, Goods, Wares or Merchandise, &c., to be Sold, or Let, or Servants Run-away, or Goods Stole or Lost; may have the same inserted at a Reasonable Rate, from Twelve Pence to Five Shillings, and not to exceed: who may agree with John Campbell, Postmaster of Boston.

All Persons in Town and Country may have said News-Letter every week, yearly, upon reasonable terms, agreeing with John Campbell, Postmaster, for the same

b They are addressed to Governor Fitz John Winthrop, of Connecticut, bearing dates from April to October, 1703, and are preserved in the collections of the Massachusetts Historical Society.

c Newspapers were at first carried free in the mails. In 1758, "by reason of their great increase," they were charged with postage at 9d. a year for 50 miles and 18d. for 100 miles.

d Postmasters started the first two papers in Boston, and succeeding postmasters seemed to claim a right to such publications, or at least to think a newspaper was an appendage to their office.—Thomas.

This extract from the autobiography undoubtedly tells the real secret of the great tendency of postmasters to become the editors of the colonial newspapers, as well as of the great advantages they derived from the office in the matter of distribution.

For fifteen years Campbell's *News-Letter* continued to be the only newspaper printed in the colonies. He met with innumerable difficulties throughout this entire period, and received but little encouragement from any source. The population of Boston was 8,000 when the first number of the *News-Letter* appeared; and in August, 1719—fifteen years later—Campbell declared, in one of his frequent appeals through his paper for a better support, that he “can not vend three hundred at an impression, tho’ some ignorantly concludes he sells upwards of a thousand; far less is he able to print a sheet every other week, without an addition of four, six or eight shillings a year, as every one thinks to give quarterly, which will only help to pay for press and paper, giving his labor for nothing. * * * * It is afforded by the year, or by the piece or paper, including the difference of money, far cheaper than in England, where they sell hundreds, nay thousands of copies to a very small number vended here”.

Difficulties of the Boston *News-Letter*.

Such proportions between circulation and population reveal at a glance the inhospitable field in which this pioneer labored. Neither the times nor the people were well adapted to the creation of a new want of this character. The settlers had lived along without newspapers, and continued to so live after the latter were at hand. There were few stirring events going on in their own midst of which they required the periodical chronicle, and the news from England and Europe interested them only in a general way, and therefore they were content to know it by word of mouth, at second or third hand, whenever it should happen to fall to their lot to hear it. The newspaper was of no aid to them in their respective business, and there was not the remotest probability of the *News-Letter* containing any first announcement of an event which affected the value of their properties, or even worked a rise or fall in the markets. The marvelous development of the later-day journalism is due not more to the increased popular intelligence or the greater energy and enterprise of its conductors than to the fact that the changes in business and in business methods have made our whole commercial life dependent upon the information which is conveyed from continent to continent, from city to city, from interest to interest, from individual to individual, through the medium of the public press. This contrast can be made more striking by glancing at the contents of Campbell's paper. At one time he expressed his regret that he found himself “thirteen months behind in giving the news from Europe”. When he did give it, it was in the shape of transcripts from the *London Gazette*, the official organ of the British government, which never contained anything the publication of which was not sanctioned by the government. Issue after issue of the *News-Letter* was almost wholly filled with the formal proclamations, the verbose addresses of deputations, and other like official matter, which then, as now, was very dull reading, especially when “thirteen months late”. There were rarely advertisements in the paper; and it was not until after the revolution that the newspaper came to be generally recognized as the most natural and direct method of business communication with the public. Campbell's powers of composition were limited, and in the matter of home or colonial news he generally confined himself to the record of the arrival and departure of vessels and an occasional brief account of a fire or the death of a citizen. The dreary monotony of the files of the *News-Letter* (a) during the entire period in which it was the only American journal affords a sufficient explanation of its admitted failure in a financial point of view.

Mechanically, it was more creditable to America, in comparison with similar work then done in England. It was printed sometimes on a half-sheet folio, sometimes on a full sheet of post paper with a small-pica type, and occasionally one of the four pages would be left blank. There were a number of weekly papers published during the last census year in the United States, and specimen copies of which are contained in the census file, which in mechanical appearance and in the quality of paper used compare unfavorably with the Boston *News-Letter*.

THE MASSACHUSETTS COLONIAL PRESS.

Upon the removal of Campbell from the post-office, in 1719, he met with his first opposition, his successor founding the *Boston Gazette*. The serene temper displayed in the journal for fifteen years was for the first time ruffled by this opposition, and the chagrin of the editor was not concealed from the public. The *Gazette* was owned and conducted by five persons, all of them successive postmasters, between 1719 and 1739, when it was merged with the *New England Weekly Journal*, a paper that had been established in 1727. A day later than the first issue of the *Gazette*, the third newspaper in the colonies, and the first outside of Boston, was founded in Philadelphia, the *American Weekly Mercury*, “Printed and sold by Andrew Bradford, at the Bible, in the Second street, and John Capson, in the High street, 1719-20.” Bradford was then the postmaster of Philadelphia, and the son of William Bradford, who established the first colonial printing office out of New England.

In 1721 the fourth paper appeared in Boston, its first issue dated August 7. It was called the *New England Courant*, and was established by James Franklin, who had recently lost the work of printing the *News-Letter* for Campbell. The father and many friends of Franklin are said to have been inimical to his project, “supposing that one newspaper was enough for the whole continent, and apprehending that another must occasion absolute ruin to the printer.” (b) Nevertheless it had been left for Franklin

The *New England Courant*.

a A complete file of the Boston *News-Letter* for the seventy-two years of its existence is preserved in the collections of the New York Historical Society.

b Thomas' *History of Printing*.

first to introduce into journalism that versatility which now began to create something of a public demand for this weekly vehicle of intelligence. He began by denouncing the *News-Letter* as "a dull vehicle", and continued by attacking the government of the province and its principal agents, the clergy and private individuals, in a free-handed manner entirely out of consonance with the spirit of the age. The controversy with the clergy grew out of a difference of opinion respecting inoculation for the small-pox, a practice which the *Courant* opposed by argument and by ridicule. The Mathers—father and son—were lampooned with a virulence seldom seen in the press of the present day, and the result was an *Address to the Publick*, by Dr. Increase Mather, in which the *Courant* was denounced as "a wicked libel", and the wrath of God was called down upon the head of its editor. This controversy was followed by repeated attacks upon the government, which, in 1722, received the notice of the general council. A committee was appointed to consider and report on the subject, which found as follows :

James Franklin and the colonial government.

The tendency of said paper is to mock religion and bring it into contempt, that the Holy Scriptures are therein profusely abused, that the reverend and faithful ministers of the Gospel are injuriously reflected upon, His Majesty's government affronted, and the peace and good order of His Majesty's subjects of this province disturbed, by said *Courant*; and for precaution of the like offense for the future the committee humbly propose that James Franklin, the printer and publisher thereof, be strictly forbidden by this court to print or publish the *New England Courant*, or any other pamphlet or paper of the like nature, except it be first supervised by the secretary of this province. (a)

The next issue of the *Courant* appeared in the name of Benjamin Franklin, and for three years thereafter, and probably until the suspension, the younger brother was the nominal publisher, although he does not appear to have remained with the paper during that period. The device was sufficient to elude the supervision of the government, and the *Courant* continued, with hardly less freedom than before, its rough and frequent criticisms upon the institutions of the province. But the effect of governmental opposition was fatal to the *Courant*. The contributors to whom it had been indebted gradually dropped away; the paper ceased to interest the public, and finally perished for lack of support. The *Philadelphia Mercury*, at the time the only newspaper in the colonies out of Boston, commented with just severity upon the re-establishment of a censorship in Massachusetts; but in the way of liberty the publisher of that paper had little to boast. Not a year before, on account of some offensive article, he had been summoned before the governor and council and compelled to make a humble apology, receiving at the same time an intimation "that he must not presume to publish anything relating to the affairs of this or any other of His Majesty's colonies without the permission of the governor or secretary". (b)

During the nine years of its existence the *Courant* received and published communications on a variety of topics from a number of persons, the friends of its publisher. Thus it set a fashion that soon became a prevailing one in the colonial papers, and opened the way for a larger and higher field for journalism than that which Campbell had marked out in the *News-Letter*.

When Green succeeded Campbell as the publisher of the *News-Letter*, in 1723, he announced that he proposed to extend his publication to the "history of nature among us, as well as of all foreign and political affairs, and, agreeable to this design, he desires all ingenious gentlemen, in every part of the country, to communicate the remarkable things they observe; and he desires them to send their accounts post free, and nothing but what they assuredly know; & they shall be very gratefully received & published. So that this paper may serve for the philosophical transactions of New England, as well as for a political history; & the things worthy of recording in this as well as in other parts of the world may not sink into eternal oblivion, as they have done in all the past ages of the aboriginal and ancient inhabitants". Green followed the example of Franklin in this respect.

This was the beginning of the outside communication to the press, which soon developed into its most prominent feature, involving the contributions of public men to the discussion of the current political questions, and for several years before the revolution many communications from able writers on the side of the government and some of its first officers, under various signatures, appeared in the *Boston News-Letter*.

Enlarging the field of colonial journalism.

When Thomas Fleet took possession of the *Boston Weekly Rehearsal*, in 1733, he blocked out a field of literary usefulness for his journal in the following ambitious announcement:

The Gentleman who first set up and has hitherto been interested in this Paper, having now resigned all his Right and Interest therein into the hands of the Subscriber, the Subscriber thinks himself obliged to give publick Notice thereof, and informs all such as have taken, or may hereafter take it, that as he has settled a Correspondence with Gentlemen in London, and most of the principal Towns within this and the neighbouring Governments, and is favoured with the acquaintance of many intelligent Persons in Boston, he doubts not but he shall be able to make the *Rehearsal* as Useful and entertaining as any of the Papers now published. And the better to effect it, requests all Gentlemen in Town or Country who may be possessed of anything new or curious, whether in the Way of News or Speculation, worthy the publick View, to send the same to him, and it will be gratefully received and communicated for the Entertainment of the Polite and inquisitive Part of Mankind. The publisher of this paper declares himself of no Party, and invites all Gentlemen of Leisure

a In Council, July 5th, 1722. Whereas in the paper called the *New England Courant*, printed Weekly by James Franklin, many passages have been published boldly reflecting on His Majesty's Government and on the Administration of it in this Province, the Ministry, Churches and College; and it very often contains Paragraphs that tend to fill the Readers' minds with vanity to the Dishonor of God, and disservice of Good Men.

Resolved, That no such Weekly Paper be hereafter Printed or Published without the same be first perused and allowed by the Secretary, as has been usual. And that the said Franklin give security before the Justices of the Superior Court in the Sum of 100l. to be of the good behaviour to the End of the next Fall Sessions of this court. Sent down for Concurrence. Read and Non-Concurred.

b Hildreth's *History of the United States*, ii, 395, first series.

and Capacity inclined on either Side, to write anything of a political Nature, that tends to enlighten and serve the Publick, to communicate their Productions, provided they are not overlong, and confined within Modesty and Good Manners; for all possible Care will be taken that Nothing contrary to these shall ever be here published. And whereas the publishing of Advertisements in the Weekly News Papers has been found of great Use (especially in such as are sent thro' all the Governments as this is) this may inform all Persons, who shall have Occasion, that they may have their Advertisements published in this Paper upon very easy Terms, and that any Customer for the Paper shall be served much cheaper than others. And whereas the Price of this Paper was set up at Twenty Shillings per Year, and so paid till this time; the present Undertaker being willing to give all possible Encouragement to his Readers has now reduced it to Sixteen Shillings; and offers all Gentlemen who are willing to hold a Correspondence, and shall frequently favour him with any thing that may tend to the Embellishment of the Paper, to supply them with one constantly free from Charge. And considering it is impossible for half a Sheet of Paper to contain all the Remarkable News that may happen to be brought in upon the Arrival of Ships from England or other extraordinary Occurrences, the Publisher therefore proposes in all such Cases, to Print a Sheet of what he judges most Material, and shall continue to send the Paper to all such as have hitherto taken it, until he is advised to the contrary by those determined to drop it, which he hopes will not be many.

The *New England Journal*, 1727, was furnished with miscellaneous essays on moral rather than political topics by literary gentlemen. Governor Burnet is supposed to be the author of a series which appeared in its third year.

The Boston *Independent Advertiser*, 1748, was supplied with well-written essays, chiefly political. A number of gentlemen associated themselves for this purpose, among them Governor Samuel Adams. They were all whigs, who advocated the rights of the people against the government. Indeed, the principal purpose of the *Advertiser* came ultimately to be political discussion, as the means to arouse the people of the province to maintain their rights. The address of the proprietors to the public is as good a declaration of the widest scope of colonial journalism as can be found. It reads:

As our present political state affords Matter for a variety of Thoughts, of peculiar Importance to the good People of New England, we purpose to insert every thing of that Nature that may be pertinently and decently wrote. For ourselves, we declare we are of no party, neither shall we promote the narrow and private Designs of any such. We are ourselves free, and our Paper shall be free—free as the Constitution we enjoy—free to Truth, good Manners, and good Sense, and at the same time free from all licentious Reflections, Insolence and Abuse. Whatsoever may be adapted to State and Defend the Rights and Liberties of Mankind, to advance useful Knowledge and the Cause of Virtue, to improve the Trade, the Manufactures, and Husbandry of the Country, whatever may tend to inspire this People with a just and proper Sense of their own Condition, to point out to them their true Interests, and rouse them to pursue it, as also any Piece of Wit and Humor, shall at all Times find (free of Charge) a most welcome reception. And altho' we do not altogether depend upon the casual Benevolence of the Publick to supply this Paper, yet we will thankfully receive every Thing from every quarter conducing to the Good of the Publick and our general Design.

The *Massachusetts Spy*, 1771, was filled with essays in the whig interest, and in 1775 it began to publish Robertson's *History of America*, completing the whole in about a year. This was followed by a history of the revolutionary war.

The custom of forming a club to write political and literary articles for newspapers was quite common in colonial days. Beside the Hell-fire Club, which contributed to Franklin's *New England Courant*, a similar club of gentlemen in Boston wrote for the *Weekly Rehearsal*, founded by James Draper in 1721, evidently at the suggestion of its members. At the head of this club was Jeremiah Gridley, afterward attorney-general of the province of Massachusetts and a member of the general court, who was the real editor of the paper. The receipts of the *Rehearsal* never amounted to more than enough to defray the expenses of publication. Of the *Connecticut Courant* (1764) Mr. Scudder says that, "with the exception of a scanty abstract of news, the paper may be said to have been edited by its subscribers—a policy which made such papers very good reflexions of the feeling of the community." (a)

Journalistic clubs.

Among the contributors to the Boston *Gazette*, which was the leading and most influential organ of the revolutionary party in Massachusetts, were Samuel Adams, Jonathan Mayhew, James Otis, John Adams, Joseph Warren, Thomas Cushing, Samuel Dexter, Oxbridge Thatcher, and Samuel Cooper. Charles Carroll was one of the writers for the *Maryland Gazette*, 1765, the year of the stamp act, and in that paper, through his influence, first appeared the famous resolutions of Patrick Henry in the Virginia house of burgesses, declaring the exclusive right of the general assembly of that state to lay taxes and impositions upon the inhabitants thereof. These resolutions were subsequently published in Franklin's *Pennsylvania Gazette*, in the Newport *Mercury*, which was instantly suppressed as a traitorous publication, in three Charleston papers, and in the Boston *Gazette*.

Political development of the colonial press.

Thus the colonists learned the divers uses to which the newspaper press might be put, and early made it a medium for the discussion of the public questions and the dissemination of the political opinions which were so speedily to become controlling in the colonies. (b)

a *Life of Noah Webster*, by Horace E. Scudder.

b Nearly all of these newspapers were issued once each week. Many of them were on diminutive sheets, and for a long time all of them clung to the prudent plan of publishing only news and advertisements, abstaining entirely from the audacity of an editorial opinion, or disguising that dangerous luxury under pretended letters from correspondents. News from Europe, when it was to be had, and especially news from England, occupied a prominent place in these little papers, but, necessarily for each one, the affairs of its own colony, and next the affairs of the other colonies, furnished the principal items of interest. Thus it was that early American journalism, even though feeble, sluggish, and timid, began to lift the people of each colony to a plane somewhat higher than its own boundaries, and to enable them by looking abroad this way and that upon the proceedings of other people in this country, and upon other interests as

THE COLONIAL PRESS OF PENNSYLVANIA.

Nevertheless, the number of newspapers did not increase rapidly. We have seen that Pennsylvania had her first newspaper in 1719—the *American Weekly Mercury*, by Andrew Bradford, worthy scion of the founder of the printing press in both Pennsylvania and New York. The *Mercury* was published by Andrew Bradford, with a temporary association with William Bradford in 1739, until his death, in 1742, after which it continued to be published “by the widow Bradford” until its suspension, in or about 1746. This paper was creditably printed and conducted, alike under Bradford and his widow. It announced its general object to be “the encouragement of trade”, and local news, obituary notices, and the like, had but small attention in its columns. Foreign news, commercial statistics, custom-house entries, including those of all the considerable ports along the coast, occupied regularly allotted space, and there were occasional literary communications and extracts from English classics. In the meanwhile, December 24, 1728, Samuel Keimer had established in Philadelphia *The Universal Instructor in all Arts and Sciences and Pennsylvania*

Slow growth of the press in the several colonies.

The Pennsylvania colonial press.

Gazette, under which pretentious title it was carried on to No. 40, nine months, never with more than one hundred subscribers, (a) when, for a trifling consideration, Keimer was glad to turn it over to the more active energy and sagacity of his former apprentice, Benjamin Franklin. Explaining his immediate success, Franklin said: “Our first papers made quite a different appearance from any before in the province—a better type and better printed—but some remarks of my writing on the dispute then going on between Governor Burnet and the Massachusetts Assembly struck the principal people, occasioned the paper and the manager of it to be much talked of, and in a few weeks brought them all to be our subscribers.” For a short time

Benjamin Franklin's *Gazette*.

Franklin published the *Gazette* twice a week, on Mondays and Thursdays, on a whole or a half sheet of pot, as occasion seemed to require; but the semi-weekly was of short duration, notwithstanding the fact that the *Pennsylvania Gazette*, as the journal was now called, became in the course of a few years the most valuable newspaper property in the colonies, circulating extensively for those times throughout Pennsylvania and in other colonies, and compelled several times to enlarge “by reason of a great increase of advertisements”. When Franklin practically retired from the management of the *Gazette*, in 1766, on account of the urgency of his public duties, he received from his former partner, David Hall, the sum of £1,000 per annum, currency, for a number of years, in lieu of his share of the profits of the newspaper and a lucrative printing business attached thereto. The *Gazette* did good service for the revolutionary cause until the British occupation of Philadelphia, in 1777, compelled its suspension until after the evacuation. It survived, with another brief suspension in 1815, until 1824. The *Pennsylvania Journal and Weekly Advertiser*, founded by William Bradford, third, December 2, 1742, divided the field with the *Gazette* until the British occupation, and, like it, was afterward revived. The *Journal* made an unsuccessful venture as a semi-weekly about 1788, and when it was discontinued, in 1797, it was to make room for the *Daily American*, a daily newspaper.

As the period of the revolution approached newspapers multiplied in Philadelphia as they did in Boston; indeed, it may be truly said that Philadelphia, from the first establishment of newspapers there, gave them a better support, both by subscriptions and advertisements, than was received by the Boston colonial press. The *Pennsylvania Packet, or the General Advertiser*, was founded in 1771, and when it returned from Lancaster, after the British evacuation, in 1778, it was published three times a week, becoming a daily paper in 1784, being known after 1786 as *Claypoole's American Daily Advertiser*, and the first daily journal established in the United States. The *High Dutch Pennsylvania Journal*, a weekly German newspaper, was founded by Joseph Orellius as early as 1743, and the *Zeitung*, a second German paper, was founded by Godhart Armbruster, the German copperplate printer, about 1748. For a considerable period previous to the revolution there were two German and two English newspapers regularly published in Philadelphia.

German colonial press.

THE COLONIAL PRESS OF NEW YORK.

New York, after Massachusetts and Pennsylvania, was the colony in which the newspaper met with the greatest success. The venerable William Bradford, then over seventy years of age, began the first newspaper there, the *New York Gazette*, October 16, 1725. (b) It was printed weekly on a foolscap sheet. He had been tempted to New York by Governor Fletcher in 1693, disgusted with the controversies which his printing press forced upon him with the dominant authorities of

New York colonial press.

precious as their own, to correct the pettiness and the selfishness of mere localism in thought. Colonial journalism was a necessary and a great factor in the slow process of colonial union.

Beside this, our colonial journalism soon became, in itself, a really important literary force. It could not remain forever a mere disseminator of public gossip or a placard for the display advertisements. The instinct of critical and brave debate was strong even among those puny editors, and it kept struggling for expression. Moreover, each editor was surrounded by a coterie of friends, with active brains and a propensity to utterance; and these constituted a sort of unpaid staff of editorial contributors, who, in various forms—letters, essays, anecdotes, epigrams, poems, lampoons—helped to give vivacity and even literary value to the paper.—Moses Coit Tyler, in *History of American Literature*, vol. ii, 304.

a Thomas' *History of Printing*.

b On May 20, 1863, the New York Historical Society celebrated, with appropriate commemorative exercises, the two-hundredth birthday of “Mr. William Bradford, who introduced the art of printing into the middle colonies of British America”, on which occasion a

Pennsylvania. He became printer to the government of New York, and his newspaper steadily supported the latter through a period of exciting and bitter controversy. November 5, 1733, (a) the second newspaper, John Peter Zenger's *New York Weekly Journal*, began publication, avowedly for the purpose of opposing the administration of Governor Cosby, in the interests of the popular party led by Rip Van Dam. Zenger's journal may be called the prototype of the American political journal of to-day. Its editor, while somewhat illiterate, was an excellent printer, and was bold and bright. The columns of his paper were filled with sharp criticism, gibes, poetical fusillades, and the like, largely the contributions of prominent opponents of the government, which so annoyed the administration that Zenger was finally arrested on an information for libel, and his subsequent acquittal taught the authorities of the colony that the time had passed in which the government could exercise unresisted surveillance over the American press. The *Journal* continued to be published by Zenger until his death, in 1746, and afterward by his widow and son until 1752, when it was discontinued. Its title was revived again in 1766 by John Holt with new types and a new printing apparatus, and the paper soon had an extensive circulation.

The *New York Gazette and Weekly Post Boy* had in the meanwhile been established by James Parker in 1742, about the time that Bradford discontinued his *Gazette*, and it was practically a continuation of Bradford's journal, and probably held most of its subscribers. In 1760 Parker formed a partnership with John Holt. Afterward Holt published the paper alone for some time, but relinquished it again to Parker in 1766, when he started his *Journal*, taking most of the subscribers of the *Gazette and Post Boy* to the new paper. Parker died in 1770, and the *Gazette* survived him but two years. In the meanwhile Holt's *Journal* maintained its ground as an earnest and fearless advocate of the popular cause until the British took possession of the city, in 1776, and its columns had many able contributors beside the editor. After the occupation the *Journal* had a migratory experience, being driven from Esopus to Poughkeepsie, whence it returned to New York in 1783. There, under the name of the *Independent Gazette, or The New York Journal Revived*, it became a semi-weekly. Holt died in 1784. Thomas Greenleaf, who purchased the establishment of the widow, made it the basis of the first daily newspaper published in New York. This appeared in 1787, and was called *The Argus, or Greenleaf's New Daily Advertiser*.

most scholarly and entertaining address was delivered by John William Wallace, of Philadelphia, Pennsylvania—himself a descendant of Bradford—in which was presented the most complete record of the work, the history, and the personal character of William Bradford that has yet been written or is likely to be written. The following are among the most striking paragraphs in Mr. Wallace's address:

"The figure of this enterprising youth, as he labored at his press in these early days, deserves, I think, to make a feature on the canvas which shall perpetuate the history of American civilization. In all other countries the typographic art has been cultivated beside the supporting walls of palaces, within the protecting close of religious houses, or under the fructifying air of patronage and wealth. Princes have been its nursing fathers and queens its nursing mothers, and nobles and bishops and scholars have watched its early progress. Westminster, the venerated abbey in which for ages England has crowned her sovereigns, and which she consecrates as the abode of her most honored dead, counts even as one of her distinctions that Caxton reared his press within her precincts. France, celebrating the munificence of the Eleventh Louis, displays, in all the richness of her art and in the costliest products of her Sevres skill and taste, upon the windows of her Louvre the monarch who sat beside her press and fostered with his care its flickering light.

"Where rank and wealth and learning have not been its cheerful supporters the press has languished or has had to wait for happier times. Even in Massachusetts no book nor paper was issued for eighteen years after the settlement of that province. Virginia and Maryland forbade the art entirely. William Bradford, establishing his press in these middle states, presents an exception to all ordinary history. He has crossed an ocean and is a thousand leagues away from the genial influences of education and taste. He has no 'assistance of the learned' nor any 'patronage of the great'. No 'academic bowers' lead the way to his humble roof nor bring scholars to watch his daily progress. No strains, pealing through long-drawn aisles and swelling the note of praise, refreshed his spirits, as they often must have Caxton's, as he grew weary with his lengthened toil. The arches above him are of the interlacing forests, and amidst the primeval oaks the curious and wondering Indian watches him in the solitary practice of his 'mystery'. He is printing the wisdom of Francis Bacon—his essays, 'Of Studies,' 'Of Counsel,' 'Of Goodnesse and Goodnesse of Nature,' 'Of Judicature,' 'Of Honour and Reputation,' 'Of Ceremonies and Respects.' His Sacred Meditations, 'Of the Moderation of Cares,' 'Of Earthly Hopes,' 'Of the Church and the Scriptures,' for the rough trader, whose soul is absorbed in schemes of gain, or for the poorer colonist, anxious only to build himself a shelter from the storm or to provide for the day that is passing over his head. His patrons are the ignorant Finlander and Swede and Hollander, whom Penn is bringing to his colony. To use his own simple but expressive words, he has 'laid out the greatest part of that small stock he had on materials for printing (which are very chargeable), and coming here found little encouragement, which made him think of going back'. Unaided he rears his humble press. With his own hand he sets the type. He imposes himself the form; corrects by his own care the pages; locks them in the chase; adjusts the register; and then, applying the full vigor of his arm and turning back the crank, lifts up the printed sheet. Behold! (exhibiting to the whole audience the open volume of Lord Bacon's *Essays*) the genius of Lord Verulam shines upon a new world! At such a moment how joyous must have been the emotions of such a man! Measuring them by the means of their accomplishment, in what other land can the art conservative of all the arts boast so noble a result?

"This issue of Bradford's press appeared in 1688, seventeen years before Benjamin Franklin was born, thirty-nine years before he established anywhere the printing press. The name of Franklin is widely revered. But the printers' calling received no addition to its dignity when the candle-end-saving genius of Poor Richard usurped the honors which in an earlier day had been paid to the author of the *Instauration*."

a "Munday, Oct. 5, 1733," was the date of the first issue of the *Journal*, but it appears that a mistake of a month was made.—Hudson's *History of Journalism*.

A number of other journals, most of them short-lived, appeared in New York previous to the revolution. The most important were the New York *Weekly Mercury*, by Hugh Gaine, "printer, bookseller, and stationer," founded in 1752, and Rivington's New York *Gazetteer, or the Connecticut, New Jersey, Hudson's River, and Quebec Weekly Advertiser*, founded in 1773. Gaine's paper was one of the best in all the colonies in its collection of intelligence, and it gained a comparatively extensive circulation in the city and surrounding settlements. But its publisher, like other publishers of the time, was ready to be upon either side in the revolutionary struggle if he could be sure it was to be the successful one; but this was not the way to journalistic success at that time. He printed his paper for some time in New Jersey after the British occupation, but soon returned, and, like Rivington, continued the publication of his paper under the protection of the king's army. With the close of the war it naturally suspended, after an existence of thirty-one years. Rivington's *Gazetteer* was printed upon a large medium sheet, folio, and was perhaps the best specimen of the typographic art that appeared in the colonies before the revolution. His sympathies were warmly with the royalists, and his circulation was confined to the tory element of the people. The end of the war was the end of the *Gazetteer*.

THE COLONIAL PRESS ELSEWHERE.

Before the revolution there were thirteen papers of all kinds started in New York colony, all but one in the city, and of these four only were in existence at its outbreak. Of these four, all save the *Journal* were in the interests of the tory or royal party, and alone survived the event.

I shall not attempt to follow the early press of the other colonies with any detail. The great bulk of the newspapers was located in Massachusetts, Pennsylvania, and New York, and their experience elsewhere was even more precarious than we have seen it to have been in these three colonies. Maryland was the fourth colony in which a newspaper was established, the *Maryland Gazette*, at Annapolis, being commenced by William Parks, probably in the year 1727, and continued irregularly until 1736. Nine years later, 1745, another *Gazette* appeared, and, with the exception of a short suspension in 1765 on account of the stamp act, was regularly published through the revolution, and is still in existence as a weekly journal, there being but one other newspaper in the United States which is of prior origin. The third Maryland newspaper, the *Maryland Journal*, appeared in Baltimore in 1773, and these three constituted the entire ante-revolutionary press of the state.

South Carolina and Rhode Island followed Maryland in 1731. The *South Carolina Gazette*, of that date, in Charleston, survived but a few months, but another, started in 1734, continued to the revolutionary war, after which it was revived. Still two other *Gazettes* were started in the colony, one in 1758, which suspended in 1780, its publisher, Robert Wells, being a royalist; and the other in 1765, born into the world for the express purpose of opposition to the stamp act, and published regularly, without stamps, after the date upon which the act was to have taken effect until 1775.

The *Rhode Island Gazette*, the first newspaper in that colony, continued but seven months in 1732-'33, and was the paper established by James Franklin after the suspension of the *Courant* and his removal from Massachusetts. The *Newport Mercury*, established in 1758, was able to maintain itself, and has been continuously published up to the date of this report. The *Providence Gazette and Country Journal*, 1762, was interrupted by the stamp act, but with that exception was a successful undertaking, and did zealous work for the cause of independence.

Virginia's first newspaper appeared at Williamsburg in 1736. As an evidence that the influence of the colonial press may easily be exaggerated, there were but two newspapers published in all Virginia previous to the outbreak of the revolution, one of them surviving only until 1750, and the other not born until 1766. North Carolina and Connecticut welcomed their first newspapers in the same year (1755), more than half a century after Campbell's venture with the *News-Letter*.

The *North Carolina Gazette*, at New Berne, lived six years, was discontinued, and established again in 1768, and, with the *Cape Fear Mercury*, was still published at the commencement of the war. The *Connecticut Gazette* appeared in New Haven in 1755, and lived until 1767.

New Hampshire's first newspaper, the *New Hampshire Gazette*, at Portsmouth, appeared in 1756, and Georgia followed in 1763 with the *Georgia Gazette* at Savannah. The *Gazette* was the only newspaper attempted in Georgia previous to the revolution, and, like many of its contemporaries, was compelled temporarily to suspend when the stamp act was passed. New Jersey had no newspaper until December 3, 1777, when the *New Jersey Gazette* was established; and the territory which afterward became the state of Vermont had its first newspaper, the *Gazette, or Green Mountain Post Boy*, in 1781, at Westminster. (a) The first and only pre-revolutionary newspaper in Delaware, the *Wilmington Courant*, established in 1762, lived but six months.

Before the close of the year 1765 there had been established in the American colonies forty-three papers of

^a The Vermonters were dependent upon the columns of the *Hartford Courant* to carry on their public controversy with the citizens and authorities of New York before and during the war of the revolution respecting their title to the present territory of Vermont.—Munsell.

which either the record or the visible evidence remains. Of these, one was in Georgia, four in South Carolina, two in North Carolina, one in Virginia, two in Maryland, five in Pennsylvania, eight in New York, four in Connecticut, three in Rhode Island, two in New Hampshire, and eleven in Massachusetts. (a) In the ten years just previous to the Revolution the number multiplied faster than in any previous epoch of like length, but still not so fast as one, looking back from this point, would naturally expect.

During the seventy-one years embraced between 1704, the year of Campbell's venture, and 1775, seventy-eight different newspapers were printed in the British-American colonies. Of this number thirty-nine were discontinued, either occasionally or permanently, and but thirty-nine were actually in process of publication at the commencement of the war. These figures, which are supplied by Thomas, furnish the only correct basis upon which to found an estimate of the influence of the newspaper press in the colonies, and of its share in producing the state of public feeling which culminated in the Declaration of Independence. In the first place, it is obvious that thirty-nine newspapers, all of them, or nearly all of them, published weekly, and none oftener, was a very small allowance for the three millions of people existing in the colonies in 1775.

Statistics of press previous to the revolution.

It is evident, from an abundance of testimony, that none of these papers had a circulation that would now be regarded as even respectable in point of size. Its average was even smaller, in proportion to population, than the average circulation of the far western newspaper of to-day, which encounters a rival at nearly every village. We have already quoted Campbell's testimony to the effect that he printed but three hundred copies of the *News-Letter* per week during the years in which he had the field absolutely to himself. The *News-Letter* existed seventy-two years, its plucky proprietors carrying it through the gathering storm of the revolution with tory principles. It was the only journal printed in Boston during the siege, and it only surrendered when the British evacuated the city. But, notwithstanding their pertinacity, its proprietors never made a profit out of it, and it may be questioned if a thousand copies of a single issue were printed during the entire seventy-two years. Franklin's *Courant* was frozen out, after a hard and brilliant struggle of seven years, by want of sufficient support.

Circulation of colonial newspapers.

From 1747 to 1759 there were but two weekly papers, Parker's *Gazette* and Gaine's *Mercury*, printed in New York city. Rivington, of the *New York Gazetteer*, informed his readers in 1773 that each impression of his *Weekly Gazetteer* amounted to 3,600 copies. A census of New York was taken in the same year, which showed its population to be 21,876 people. It is probable that Rivington was guilty of the more modern device of exaggerating his circulation.

New York.

November 1, 1780, Thomas, in his *Worcester Massachusetts Spy*, issued an appeal for more generous support, in which he said:

Massachusetts Spy.

For twelve months past the number of customers for this paper has been so small as to be by no means adequate to its support, by which means the printer has absolutely sunk money by its publication. Books, schools, and newspapers are become too much neglected, and of consequence the rising generation will be great sufferers thereby if these necessary things, which tend to learning, are not more encouraged.

It further appears from this notice (b) that the subscribers were in the habit of stopping their subscriptions in the winter time, and Thomas threatened to accept a proposal to remove his establishment to another town if more subscribers, who would continue through the winter months, were not forthcoming.

Mr. Thomas puts the average circulation of the four newspapers which were printed in Massachusetts (all in Boston) in 1754 at 600 from each press. The total list of subscribers to his *Massachusetts Spy* in 1771, on the occasion of its conversion from a semi-weekly to a weekly paper, upon his own authority, was less than 200, although it increased rapidly from that time, until in two years "its subscription list was larger than that of any other paper in New England".

The great mortality among the colonial press—just one-half of the whole number established suspending before 1775—is the conclusive evidence of small and unprofitable circulation, although the high cost of materials, especially paper, the stamp acts in Massachusetts and New York, and the oppressive supervision of the authorities, must also be taken into consideration in accounting for this mortality.

POLITICS OF THE COLONIAL PRESS.

Then not all the press was political, and not all the press that was political was whig. Several journals permitted the revolution to break over their heads without alluding to the causes which were in operation to bring it about, and a number occupying relations with the government authorities through their acceptance of the public printing were neutral in their attitude or violently hostile to the patriot cause. (c) In his *History of American Loyalists* Sabine makes a definite statement of the political division of the colonial press. He says:

The neutral and the tory press.

Of the thirty-seven newspapers which were published in the colonies in April, 1775, seven or eight were in the interest of the crown, and twenty-three were devoted to the service of the whigs. Of these thirty-seven, however, one on each side had little or no part in discussing the great questions at issue, as they were established only in the preceding month of January, and of those which

a Tyler's *History of American Literature*.

b Hudson's *History of Journalism*, p. 131.

c Speaking of the Williamsburg *Gazette*, established in 1766, Thomas Jefferson wrote: "Till the beginning of our revolutionary disputes we had but one press, and that, having the whole business of the government, and no competitor for public favor, nothing disagreeable to the governor could find its way into it. We procured Rind to come from Maryland to publish a free paper."

did participate in these discussions and maintain the right no less than five went over to the loyalists in the course of the war. Of the number first named, two were printed in German and English; and, as another of the thirty-seven was commenced in April, there were, in fact, but thirty-one newspapers in the vernacular tongue at the close of 1774. Up to the beginning of the strife printing had been confined to the principal towns, but hostile deeds, interfering with all employments, caused the removal of some of the journals to places more remote, and were the means of interrupting or wholly discontinuing the publication of others. Those that existed at the period of which we are speaking were very unequally distributed; thus, Maryland, Virginia, the two Carolinas, and Georgia, taken together, had but one more than Pennsylvania, and but three more than Massachusetts. In New Hampshire the *Gazette* was alone, while Rhode Island had both a *Gazette* and a *Mercury*. Of the editors and proprietors who originally opposed the right or became converts to the wrong several sought refuge in Nova Scotia and New Brunswick, where they established newspapers, which were the first published in these colonies.

The individual responsibility for the position and utterances of the newspaper made it naturally conservative—a follower rather than a leader. The real contribution of the printing press to the revolutionary cause was through the medium of the occasional tract or pamphlet, to which allusion has already been made.

Let us not, however, underestimate the services to the patriot cause rendered by the few journals which did what they could in that cause, and did it with boldness, zeal, and disregard of consequences. At the head of this class

Services of press to
the revolutionary cause.

of colonial journals stand the *Boston Gazette and Country Journal*, founded by Benjamin Edes and John Gill, April 7, 1755, and the *Massachusetts Spy*, founded by Isaiah Thomas, August 7, 1770. The *Spy* was started shortly after the suspension of the *Boston Chronicle*, which had been founded in 1767, and had rendered itself obnoxious to the whig element of the community by assailing the citizens who differed with the advocates of the British administration. Four other papers were in the meanwhile regularly published once a week in Boston, viz, the *News-Letter*, the *Evening Post*, the *Gazette*, and the *Weekly Advertiser and Post Boy*. Of these the *News-Letter* and the *Weekly Advertiser and Post Boy* were conducted in the interests of the government. The *Gazette* was warmly enlisted for the whig cause, and the *Evening Post* was apparently neutral or indifferent, paying little or no attention to political controversy and a great deal to religious controversy. Under these circumstances there appeared to be great need for another journal devoted to the patriot cause, while there was very little to encourage the hope of its financial success. In 1768 the *Boston Chronicle* had set the fashion of a semi-weekly publication, it being the first newspaper published oftener than once a week in New England. It increased its issue from once to twice a week without any addition to the cost to the subscriber, which was six shillings and eight pence—"but a very small consideration," according to Thomas, "for a newspaper on a large sheet and well executed." Mr. Thomas proposed to publish his paper three times a week, on Tuesdays, Thursdays, and Saturdays, and did so publish it for three months, giving his readers a quarter-sheet twice a week and a half-sheet once a week. At the end of that period the tri-weekly was replaced by a semi-weekly, which ran for three months longer, when, that also proving unprofitable, the enterprise was started anew, on March 7, 1771, as a weekly. This was printed on a whole sheet, royal size, folio, with four columns, and was a larger paper than any that had thus far been published on the continent. There are few weekly newspapers now published in the United States which do not contain from three to twenty times the amount of reading matter for which there was room in the columns of the *Massachusetts Spy*.

The *Spy* was supplied with communications from the ablest political writers of the day. It began by admitting controversial articles upon both sides of the great question, but its leanings were so clearly whig that the loyalist element gradually withdrew altogether from its subscription lists, and the *Spy* thereafter devoted its entire energies to the furthering of the patriot cause. Some of the contributions in its columns were powerful and effective specimens of argument and invective, notably those signed "Centinel", "Leonardas," and "Mucius Scaevola". In the meanwhile John Adams, Josiah Quincy, jr., and other patriots only less distinguished, were regularly contributing to the columns of Edes & Gill's *Gazette and Country Journal* the series of papers on political questions which produced the most marked influence in shaping and stimulating the public opinion of the time. In the columns of this newspaper "every innovation upon the chartered privileges of the colonies was examined, reviewed, reprobated, and condemned with a freedom which knew no fear and a severity which despised all control". (a)

It was in January, 1775, that John Adams began the publication in the *Gazette* of the celebrated series of papers signed "Novanglus", in reply to the contributions of Jonathan Sewell, published in the *News-Letter*, and signed "Massachusettensis". Mr. Adams' series ran through several months of the most exciting period just prior to the outbreak of hostilities. They often filled two or three pages of the *Gazette*, and their singular clearness of reasoning and vigor of style gave them a wide circulation, and made them, on the whole, the most cogent expression of the case for the revolutionists which found the light of the types in the colonies.

The contributions of Josiah Quincy, jr., to the *Gazette* were hardly less powerful and eloquent, and certainly no less bold, than those of John Adams. They were published over a variety of signatures, and it is probable that the whole number of them are not identified as from his pen. These and other writers who had begun their criticisms upon the measures of the government almost from the first establishment of the *Gazette*, in 1755, continued their fire, with increasing directness and indignation, at each successive obnoxious act of government—the stamp act, the massacre, the tea tax, and the closing of the port of Boston—until the plucky publisher (b) was driven by

a Buckingham's *Reminiscences*, vol. i, p. 167.

b Gill was not concerned in the publication of the *Gazette* after April, 1775. In 1776 he began the publication of a new paper, called the *Continental Journal*. After the war the *Gazette* was surpassed by many rivals, and lingered along, without any distinguishing features, until 1798, when the venerable publisher published his valedictory and the paper died. The *Spy* continued to be published in Worcester, where it met with sundry difficulties which occasioned temporary suspensions, but, reckoning from the date of establishment, it is now the oldest journal in Massachusetts.

the commencement of hostilities to remove his press from Boston to Watertown, where, after a brief suspension, the *Gazette* continued to be published until the evacuation of Boston permitted his return. Mr. Thomas, in the same way, moved the *Massachusetts Spy* to Worcester.

Massachusetts was almost unique in the possession of these journals, so wholly and earnestly enlisted in the cause of the colonies against Great Britain; and in estimating their influence it is proper to compare the revolutionary feeling existing in that colony, where it had these exceptional stimulants, with the same feeling in other colonies, which were largely without such stimulants. The difference was not sufficiently marked to justify us in assigning any exceptional influence to the periodical press in bringing about the revolution. This conclusion is further justified by the fact that Massachusetts was the scene of the most aggressive measures of the government, as well as of the first bloodshed, and that the revolutionary spirit was precipitated there by a certain priority of events.

Prominence of the Massachusetts press.

COLONIAL NEWSPAPER TYPOGRAPHY.

In their mechanical construction and typographical appearance the journals of the colonial epoch differed from those of the present era quite as widely as in their contents and functions. Until about 1770 they were generally printed on half sheets of varying shapes and sizes; the earlier size was ordinarily 7 by 9 or 10 inches. The Boston *News-Letter* of 1704 was printed on a half sheet 7 by 13 inches. This was the size of Franklin's *New England Courant*, the *New England Journal*, and several other papers of the era between 1720 and 1770. Frequently the publisher of these and other journals varied the size of their periodicals. They would print on a half sheet folio or quarto of different sizes, as they found it convenient, most of the paper used in America before the revolution being imported from England, and it often being impossible to obtain uniform paper. Sometimes an enterprising publisher would give his readers an occasional whole sheet. This practice was first inaugurated by the Boston *Gazette* of 1719, but it frequently happened on such occasions that one entire page would be left blank.

Mechanical and typographical characteristics of the colonial press.

About the year 1760 it became the custom with all or most of the Boston journals to print a whole sheet (crown) regularly. A calculation of the number of ems of type in these journals shows the average to have been: for the half sheets, from 3,000 to 7,000, according to the size of the type; for the whole sheets, 6,000 to 14,000, or about the contents of from one to two columns of the New York *Herald* of to-day. There were generally two columns, three-inch measure, to a page, although it occasionally happened that one broad column sufficed, or one column occupied the first page and two columns the others. The colonial journals varied as widely in their typography as in their size. Many varieties of type were brought into use: pica, small pica, english, roman, brevier, great primer, and long primer, the latter being the size and style more commonly used. It was not often that more than one style of type was put to use on one paper, except in the matter of head lines. Reading matter and advertisements were all printed alike. The latter were rarely "set off" from the literary contents in the early newspapers by rules, and the two-line letter does not appear in advertisements until near the revolutionary epoch. At that time it began to be customary to use great-primer flowers between the letters. Frequent use was also made of illuminated letters for capitals.

Amount of reading matter.

The composition on these early papers was generally accurate, and the orthography compares favorably with that of the English press of the same date. In both countries the capital letter was used with an extraordinary and unaccountable freedom, the general custom being to capitalize all nouns, and as many other words as possible.

The press-work was also good, considering the character of the wooden presses upon which it was executed.

The captions of the colonial journals were uniformly plain, and quite as uniformly contained for a secondary line the now obsolete legend, "Containing the Freshest Advices, Foreign and Domestick;" and many of the first papers added the expression, "Published by authority," by way of indicating that the approval of the authorities to the enterprise had been obtained.

DEVICES.

A distinguishing peculiarity was the device of the caption. These devices first appeared in the Boston *Gazette* of 1719, which was adorned with a cut of a ship on the right and one of a postman on the left of the title. These devices were frequently changed. The *Gazette*, above referred to, which was discontinued in 1752, had at one time devices of a postman on horseback (Fig. 1), a pine tree, and a news-carrier holding a copy of the paper in his hand. They were of the rudest possible workmanship, and often quaintly inartistic in design and ludicrously unsymmetrical in proportion. At first these devices appear to have been used merely by way of embellishment or as distinguishing marks. The successor to the Boston *Gazette*, above mentioned, displayed a cut which had been designed to accompany one of Æsop's fables. Mr. Fowle, after establishing the *New Hampshire Gazette*, appears to have luckily fallen in with a series of cuts made to illustrate an edition of Æsop, and from time to time he enlivened his caption by substituting one for another of them. After a while these embellishments came to have either a journalistic or a political significance. William Bradford's New York *Gazette* (1725) was adorned with badly-executed cuts of the arms of New York, supported by an Indian on either side, with a crown for the crest. Andrew Bradford's Philadelphia *Mercury* (1719) had a small

Allegorical devices.

figure of Mercury, bearing his *caduceus*. Cuts of the king's arms were frequently used, several tory journals continuing to display them down to and into the revolution. The devices were frequently accompanied by mottoes, often in Latin, and sometimes bristling with the vehemence of the *Massachusetts Spy's* "Americans! Liberty or Death! Join or Die". The *Constitutional Courant*, one issue of which was published at Burlington, New Jersey, in 1765, had in its title a device representing a snake, divided into eight parts, each part denoting a section or colony, the head and neck representing New England, and the body the middle and southern colonies, and under it the motto, "Join or Die" (Fig. 2). There was no mistaking the significance of this device. Mr. Thomas

Fig. 1.

JOIN or DIE

Fig. 2.

afterward adopted a modification of it for his *Spy*. He was also fruitful with his own devices. He originally used a cut of the goddess of liberty, seated upon a pedestal. A still later one in the *Spy* (Fig. 3) is thus explained in its full allegorical significance by Mr. Thomas himself:

The device on the left is a figure representing America, an Indian holding the cap of Liberty on a staff with the left hand, and in the right a spear, aimed at the British Lion, which appears attacking her from the opposite shore. That on the right is a chain of thirteen links, with a star in each link, representing the union of the thirteen states; the chain is placed in a circular form, leaving an opening for the arms of France, to which the ends of the chain are attached. Above the arms are two hands, clasped, and directly over them a sword, with its hilt resting on the clasped hands.

Other devices, like that of the *Independent Ledger and American Advertiser* of Boston, in 1778 (Fig. 4), were symbolical of the union of hand and purpose on the part of the thirteen colonies.

Fig. 3.

Fig. 4.

These devices, indicating with varying intensity of allegory the convictions and principles of the journals adopting them, began to disappear from the captions after the revolution and with the disappearance of the causes which created the political feeling in the colonies. The American press, so far as it has not discarded these titular emblems altogether, is now content with miniature printing presses, occasional portraits of Benjamin Franklin, or goddesses of liberty, which, from an artistic point of view, are not more deserving of praise than the devices which disfigured the colonial press.

PRICES OF COLONIAL NEWSPAPERS.

The colonial newspapers were sold at prices which varied according to the location and the currency of that location. The latter fluctuated so frequently in value that it is not always possible at this date to determine precisely the sum that the publisher regarded himself entitled to receive from his patrons; but there is sufficient reason to believe that this sum was a nearly uniform one in the respective colonies, and that it did not vary greatly in any one colony from the standard established in all the others. John Campbell, when he founded the *News-Letter* in 1704, may be said to have established for his own

Prices.

and for subsequent generations the prevailing price of the weekly newspaper. He received the equivalent of \$2 of our present currency, but did not think it worth while to advertise his price of subscription in the paper itself. This was a neglect to take advantage of an opportunity which found several imitators in the subsequent colonial newspapers. The *Boston Gazette and Weekly Journal* (1719) was sold for 16s. a year, and 20s. when sealed, payable quarterly, and at the value of currency at that time this was equivalent to \$2 50 in our present money. The *American Magazine*, a monthly periodical of 50 pages, founded in 1743, was sold for 3s., new tenor, a quarter, being at the rate of 50 cents, or \$2 per annum. The *Rehearsal*, founded in 1731, was sold originally for 20s., but was reduced from that price to 16s. when Fleet took possession of it in 1733.

The *Boston Advertiser* was sold for 5s. 4d. "lawful money", and the *Boston Chronicle* (1767) for 6s. 8d.—"but a very small consideration for a newspaper on a large sheet and well printed," according to Thomas, but likely to be regarded as a high price for a similar newspaper in these days. The *Christian History*, weekly, 1743, was sold for 2s., new tenor, per quarter, but subsequently 6d. more was added to its price, "covered, sealed, and directed." The *American Magazine and Historical Chronicle*, a monthly of 50 pages, sold for 3s., new tenor, per quarter, the equivalent of \$1 50 per year. Nevertheless, 6s. 8d. appears to have been the ruling price at this period, for the *Salem Essex Gazette* (1768) and the *Norwich Packet* (1773) were vended at that rate. The *New Hampshire Gazette* (1756) was sold for "one dollar per annum, or its equivalent in bills of credit, computing a dollar this year at four pounds, old tenor". The *Portsmouth Mercury* (1765) was sold for "one dollar, or six pounds o. t. per year; one-half to be paid at entrance". Thomas Fleet, who discontinued the *Weekly Rehearsal* in 1735 and began the publication of the *Boston Evening Post* on a half sheet of large foolscap paper, regarded the prevailing price for newspapers altogether too low, and in a dunning advertisement to his subscribers he declared:

In the days of Mr. Campbell, who published a newspaper here, which is forty years ago, Paper was bought for eight or nine shillings a Ream, and now tis Five Pounds; his Paper was never more than half a sheet, and that he had Two Dollars a year for, and had also the art of getting his Pay for it; and that size has continued until within a little more than one year, since which we are expected to publish a whole Sheet, so that the Paper now stands us in near as much as all the other charges.

In Pennsylvania the prices of newspapers were more uniform than in New England. The *Philadelphia American Weekly Mercury*, the first paper founded in that city, and the first outside of New England, being the third in the colonies, was sold for 10s. per annum. The *Philadelphia Gazette* (1733) was sold for the same price, as was also the *Philadelphia Journal* (1766), the *Chronicle* (1767), and the *Ledger* (1775). The *Philadelphia Evening Post*, founded in 1775, and issued three times a week, was sold at a price of two pennies for each paper, or 3s. the quarter. The *Dutch and English Gazette* was sold for 10s. in 1749, when it was a weekly publication, and for 5s. in 1751, when it became a fortnightly publication. The *New York Weekly Journal* (1733) was sold for 3s. the quarter. The *Virginia Gazette* (1766) was 12s. 6d. per year. There was a notable increase in prices during the war in several cases, and the *New Jersey Gazette*, which was founded in 1777, fixed its price at 26s. per annum.

INFLUENCE OF THE REVOLUTIONARY WAR UPON THE PRESS.

Such was the condition and the characteristics of the colonial press at the time of the outbreak of the revolution. It had not yet been able to reach the position of a recognized force in politics and in society. It had done good service for the patriot cause, but had still been only a secondary element in the tide that was sweeping the colonies toward independence. Its usefulness was circumscribed by a variety of causes, one of which, at least, the revolution did more than aught else to wholly remove. With the outbreak of hostilities all attempts of the government to regulate and control the public press came to an end, and in all the colonies the breaking loose from the control of England seems to have been accepted as carrying with it the abrogation of the laws and customs inherited from the mother country which involved anything like a censorship of the press or a governmental control of its utterances. As colony after colony organized state governments and adopted constitutions for self-government the freedom of the press, under the restrictions which still obtain for the regulation of its utterances in reference to individuals, was recognized as a cardinal point in free institutions. The influence of the revolution in producing the liberty of the American press, as we understand the meaning of that phrase, has not been generally recognized, and can only be fully appreciated by a consideration of the restrictions which surrounded its utterances under the colonial system and the complete independence of governmental control which has ever since been its birthright. In Great Britain it was many years afterward before this principle was recognized as a fundamental one.

Secondary influence of the colonial press.

Freedom of press established by the revolution.

CONSTITUTIONAL GUARANTEES OF A FREE PRESS.

When the Constitution of the United States was framed there was no provision included in it regarding the freedom of the press, the general convention having left this subject to the common understanding and established opinion of the people. It is true that Charles Pinckney, of South Carolina, on May 29, 1787, laid before the convention a draft of a plan of federal government which he had prepared, in which was included a provision declaring that "the legislature of the United States shall pass no law touching or abridging the liberty of the press", (a) and that on August 20 of the same year Mr.

The federal Constitution and the press.

a *Debates on the Adoption of the Federal Constitution*, as reported by James Madison, revised and newly arranged by Jonathan Elliot, p. 131. Washington: 1845.

Pinckney submitted to the convention, for reference to the committee of detail, a series of propositions, in which was included the declaration that "the liberty of the press shall be inviolably preserved". Neither of these propositions having been incorporated in the Constitution, the first Congress, by way of amendment to the Constitution, resolved that "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof, or abridging the freedom of speech or of the press, or of the right of the people peaceably to assemble and to petition the government for a redress of grievances".

But previous to the adoption of this amendment to the federal Constitution there had been express provision made in the constitutions of each of the several states which adopted new constitutions to prevent an abridgment of the liberty of the press. It is interesting to recall these provisions, and to observe how carefully they have been preserved in all the subsequent constitutional modifications of the original states and incorporated in the constitutions of those states which have since been admitted to the federal union.

New Hampshire. The constitution of New Hampshire (1784), article XXII, declares that "the liberty of the press is essential of freedom in a state; it ought, therefore, to be inviolably preserved". This provision was identically preserved in the constitution of 1792, which is still in force in that state.

Massachusetts. In Massachusetts the declaration of rights prefixed to the constitution of 1780 declares that "the liberty of the press is essential to the security of freedom in a state; it ought not, therefore, to be restrained in this commonwealth"; and this declaration of rights remains unaltered and in full force.

New York. The convention which framed the constitution of New York (1777) contented itself with declaring, ordaining, and determining that "such parts of the common law of England, with the statutes adopted and the acts of their own legislature, as together did form the law of the colony in 1775, shall continue, subject to the alterations of the legislature". They regarded the freedom of the press as established by the common law. But the second constitution of New York (1821) contained this explicit declaration (article VII, section 8):

Every citizen may freely write, speak, and publish his sentiments on all subjects, being responsible for the abuse of that right, and no law shall be passed to restrain the liberty of speech or of the press. In all prosecutions or indictments for libels the truth may be given in evidence to the jury, and if it shall appear to the jury that the matter charged as libelous is true, and was published with good motives and for justifiable ends, the party shall be acquitted; and the jury shall have the right to determine the law and the fact.

This significant declaration was introduced into the organic law of New York as a direct consequence of the large number of libel suits which had resulted from the exciting politics of the previous years—suits in which a variety of constructions of the existing law were adopted and the press was held to have suffered unjustly. The provision of 1821 still remains in the constitution of New York.

Pennsylvania. The state of Pennsylvania was more explicit than New York on this subject in its second constitution (1790). The provision reads:

That the printing press shall be free to every one who undertakes to examine the proceedings of the legislature or any branch of the government, and no law shall ever be made to restrain the right thereof. The free communication of thoughts and opinions is one of the invaluable rights of man, and every citizen may freely write and print on any subject, being responsible for the abuse of that liberty. In the prosecutions for publications of papers investigating the official conduct of officers or men of public capacity, or where the matter published is proper for public information, the truth thereof may be given in evidence; and in all indictments for libels the jury shall have a right to determine the law and the facts, under the direction of the courts, as in other cases.—Article 9, section 7.

This provision was retained in the constitution of 1838, and also in the existing constitution of 1873, with an important modification of phraseology, to wit:

No conviction shall be had in any prosecution for the publication of papers relating to the official conduct of officers or men in public capacity, or to any other matter proper for public investigation or information, where the fact that such publication was not maliciously or negligently made shall be established to the satisfaction of the jury.

Provisions almost identical with the original Pennsylvania clause quoted above were incorporated in the first constitutions of the states of Arkansas, Alabama, Illinois, Kentucky, Tennessee, and Texas.

South Carolina. South Carolina, in her original constitution (1776), committed the privilege to the keeping of the common law as understood by the people, but the constitution immediately thereafter adopted (1778) contains the declaration "that the liberty of the press be inviolably preserved". This declaration disappeared in the constitution of 1790, and did not again appear in that of 1865; but in the constitution of 1868, sections 7 and 8, article I, there appears the following:

All persons may freely speak, write, and utter their sentiments on any subject, being responsible for the abuse of that right, and no law shall be enacted to restrain or abridge the liberty of speech or of the press. In prosecutions for the publication of papers investigating the official conduct of officers or men in public capacity, or where the matter published is proper for publication, the truth thereof may be given in evidence; and in all indictments for libels the jury shall be the judges of the law and the facts. (See Pennsylvania.)

Georgia. The Georgia constitution (1777) declared that "the freedom of the press and trial by jury shall remain inviolate", and this provision remained intact in the constitutions of 1789 and 1798. In the declaration of rights of the constitution of 1865 was the following:

Freedom of speech and freedom of the press are inherent elements of political liberty. But while every citizen may freely speak, write, or print on any subject, he shall be responsible for the abuse of the liberty.

The same phraseology remains in the constitution of 1868.

The North Carolina constitution (1776) declared "that the freedom of the press is one of the great bulwarks of liberty, and therefore ought never to be restrained". The constitution of 1868 retained this phraseology, with the proviso added that "every individual should be held responsible for the abuse of the same", and thus it stands in the constitution of 1876. North Carolina.

In the bill of rights which accompanied the Virginia constitution of 1776 is the declaration "that the freedom of the press is one of the great bulwarks of liberty, and can never be restrained but by despotic governments". This declaration of rights was re-enacted with the constitutions of 1830, 1850, 1864, and 1870, in the latter instrument the clause being added: "And any citizen may speak, write, and publish his sentiments on all subjects, being responsible for the abuse of that liberty." Virginia.

The Maryland constitution (1776) in the "declaration of rights" asserted "that the liberty of the press ought to be inviolably preserved". This clause is repeated in the declarations prefixed to the constitutions of 1851 and 1864, the same qualification quoted in the case of Virginia being added in the last instrument. Maryland.

The original constitution of New Jersey (1776) contained no declaration regarding a free press, but that of 1844 contains this explicit provision—the most explicit in reference to the rights of publishers in libel cases which had been incorporated in the fundamental law of any state up to that time: New Jersey.

Every person may freely speak, write, and publish his sentiments on all subjects, being responsible for the abuse of that right. No law shall be passed to restrain or abridge the liberty of speech or of the press. In all prosecutions or indictments for libel the truth may be given in evidence to the jury, and if it shall appear to the jury that the matter charged as libelous is true, and was published with good motives and for justifiable ends, the party shall be acquitted, and the jury shall have the right to determine the law and the fact.

Substantially this provision, commanding verdicts for defendants where the truth of the statements complained of is proven and the motives of publication are justifiable, is now incorporated in the constitutions of New York, Connecticut, Illinois, Kansas, Rhode Island, Wisconsin, West Virginia, Maine, Ohio, Iowa, Nevada, and Colorado. In other states, where the phraseology of the Pennsylvania constitution is the model, this provision is limited in its application to publications relating to the official conduct of public officers or men in public capacity.

The first constitution of Vermont (1777) declared as follows:

The people have a right to freedom of speech, and of writing and publishing their sentiments concerning the transactions of government, and therefore the freedom of the press ought not to be restrained. Vermont.

This phrase reappeared in the constitutions of 1786 and 1793, which latter remains the organic law of the state.

New constitutions were not formed in the states of Rhode Island and Connecticut upon the declaration of independence, the former state continuing to be governed under its original charter, granted by the English government in 1663, until this charter was superseded by the constitution of 1842, in which the declaration took this form: Rhode Island.

The liberty of the press being essential to the security of freedom in a state, any person may publish his sentiments on any subject, being responsible for the abuse of that liberty; and in all trials for libel, both civil and criminal, the truth, unless published from malicious motives, shall be sufficient defense to the person charged.

This constitution remains unchanged, except by minor amendment.

The Connecticut charter of 1662 made way for a constitution in 1818, in which appeared a more explicit declaration than had yet been given place in any organic law, giving the right to freely speak, write, or publish, forbidding the passage of any law at any time to curtail or restrain the liberty of speech or of the press, and finally providing that "in all prosecutions or indictments for libel the truth may be given in evidence, and the jury shall have the right to determine the law and the facts, under the direction of the court". Connecticut.

The second constitution of Delaware (1792) provided as follows:

The press shall be free to every citizen who undertakes to examine the official conduct of men acting in a public capacity, and any citizen may print on any subject, being responsible for the abuse of that liberty. In prosecutions for publications investigating the proceedings of officers, or where the matter published is proper for public information, the truth thereof may be given in evidence; and in all indictments for libels the jury may determine the facts and the law, as in other cases. Delaware.

This section is retained without change in the constitution of 1831, and provisions practically identical with one or the other of those quoted above appear in every one of the thirty-eight state constitutions as they exist to-day.

The constitution of West Virginia contains one of the exceptional organic clauses relating to the freedom of the press, as follows: West Virginia.

No law abridging the freedom of speech or of the press shall be passed; but the legislature may, by suitable penalties, restrain the publication or sale of obscene books, papers, or pictures, and provide for the punishment of libel and defamation of character, and for the

recovery, in civil actions, by the aggrieved party of suitable damages for such libel or defamation. In prosecutions and civil suits for libel the truth may be given in evidence, and if it shall appear to the jury that the matter charged as libelous is true, and was published with good motives and for justifiable ends, the verdict shall be for the defendant. (a)

THE EXISTING LAWS OF LIBEL.

These provisions of the organic law, which guarantee to the press of the several states the sacred right of free speech, and accompany the responsibility for the exercise of that right with the privilege of trial by jury upon the law and the facts, are supplemented in each state by statutory provisions regarding actions for libel, civil and criminal. Everywhere it is established in our jurisprudence that the guarantee of free speech does not involve the freedom from those restraints which regulate that speech to the requirements of public decency and public order and to the protection of private character. The abuse of the freedom of the press has made the United States more prolific of libel suits than any other country in the world. The law offers every facility to the individual for such redress for defamation of character as pecuniary damages can bring; and if the experience of the country is that

juries are not prone to award heavy penalties in such cases, the fact remains that every publisher, after every issue of his newspaper, is at the mercy of any person who may regard himself as aggrieved by some publication therein, and that many publishers have become involved in expensive and annoying litigations in consequence of the courageous consecration of their press to the exposure and extirpation of public wrongs. While there is no decrease in the universal feeling that public and private rights demand full legal protection from the malicious publisher, there is an increasing feeling, on the other hand, that the publisher should be better protected from the malicious prosecutor. The uncertainty of the result in an action against the proprietor of a newspaper for libel deters many from attempting to pursue this method in the vindication of their character. This distrust, it will be conceded, does not arise from any indefiniteness or uncertainty in the law, or in the method of its expounding by the courts. On the other hand, there is an increasing tendency, observable of late years, to resort to the law for purposes which may be described as nearly akin to blackmail and intimidation. From the standpoint both of the public and the publisher, therefore, the existing libel laws of the United States are capable of modifications that will better adapt them to the purposes for which they are devised, and it is not to be expected that journalism will ever outgrow the tendencies which render it necessary to throw these legal restraints around the free press of the United States. In a country where the establishment of a newspaper is such a common and easy affair it is to be expected that some newspapers will always exist whose conduct is not regulated by that scrupulous regard for private rights which has long distinguished the better class of American journals and is developed to a most admirable degree in the press of England. The nature of our political institutions and the fierceness of our party politics have always developed in the press a greater freedom of personal reference, accompanied by bitterness and vindictiveness of criticism, than is seen elsewhere. Of this, however, it is safe to say that there is much less than existed in the early history of American newspapers, while the gross and vulgar intrusion into private affairs, merely for the gratification of a prurient public taste for sensationalism and scandal, has long been confined to publications of no recognized standing in the community.

THE PRESS DURING THE REVOLUTION.

The American press, emerging from the revolution with the great advantage of free utterance guaranteed in the organic law to compensate it for the trials of that ordeal, was compelled to pay to the full the penalty which war imposes upon all classes of society and all elements of material wealth. It had not yet made itself a necessity, for its issues were still but once a week, and were therefore, as a rule, behind the news which the people were eager enough to learn, but which they found themselves learning more expeditiously by word of mouth than from the printed page. For this reason there was no such unusual increase in the circulation of the existing newspapers as ordinarily accompanies the outbreak of a war. The information they did convey was necessarily meager, owing to the lack of facility and ability to print or to obtain details. Journalistic enterprise, as we understand that phrase in these days, was an undeveloped element, and the cost and difficulties of publication were inordinately increased. Paper was extremely scarce, and toward the close of the revolutionary war piteous appeals to the people to save their rags for the paper-mills, which necessity had established in several colonies, began to appear in the prints. Skilled printers were few in number, and there had ceased to be any fresh arrivals from England and the continent, and worn-out types could not be replenished except at a cost which was ruinous. These causes prevented that rapid multiplication of newspapers in the sections not actually involved in the war, such as is usually seen in such times.

At the headquarters of the press, in the cities of Boston, New York, and Philadelphia, other difficulties of an even

^a The constitutions of the states and of the United States use the word *press* as descriptive of the free communication of ideas and sentiments by the art of printing. By the freedom of the press they undoubtedly intended an unrestrained use and free improvement of the privilege of writing and printing in the communication of sentiments and opinions on matters of public concernment, governmental measures, and political procedures; not a licentious and destructive abuse of the privilege in such a manner as that wicked and malicious men should gratify their resentment, malevolence, and revenge to the overthrow of family reputation and the ruin of their neighbors' character.—James Sullivan's *Dissertation*.

more serious nature interfered with progress. With the successive occupation of these several cities by the British troops there was nothing for the publishers of patriotic newspapers to do but to pack up their accouterments as best they could and make their escape to other points, whence they could not supply their regular subscribers nor command their ordinary facilities, and frequently they found it necessary to suspend publication altogether for weeks and months. The most notable cases of removal were those of Thomas' *Massachusetts Spy*, which went from Boston to Worcester; Edes' *Gazette*, removed from Boston to Watertown, whence it returned after the evacuation; the *Newport Mercury*, from Newport to Attlebury, Massachusetts; and the *New York Journal*, to Kingston (Esopus), and thence, upon the approach of the British, to Poughkeepsie. The patriot newspapers printed in Philadelphia at the outbreak of the war were suspended altogether during the period that the British remained in possession of that city.

Suspension of the Boston, New York, and Philadelphia presses.

The royalist papers published in these cities at the outbreak of the revolution continued to print, generally under the protection and encouragement of the British authorities; but their difficulties were hardly less than those of their expelled contemporaries, as the citizens, sympathizing with the cause of independence, refused to patronize them, and the meager support remaining compelled several of them to suspend. Rivington's *New York Gazetteer*, which had "a very extensive circulation" in the principal towns surrounding from the supporters of the government, was descended upon by a body of armed men in 1775, which destroyed the press, pried the type, and effectually stopped its publication. Returning to England, Rivington supplied himself with a new printing outfit, and was appointed king's printer for New York. Coming again to that city when the British gained possession, he re-established the *Gazetteer*, under the title of Rivington's *Loyal New York Gazette*, "Published by James Rivington, Printer to the King's Most Excellent Majesty." This paper naturally suspended for want of support shortly after the close of the revolution, although its editor, by discarding the royal arms and pledging himself to print an impartial and complete newspaper, struggled hard to live down the prejudice excited by his conduct in the war.

The royalist press.

The list of newspapers which were in existence in the colonies in the year 1775, as compiled by Thomas, is probably nearly, if not quite, accurate. It shows them to have been thirty-seven in number, of which one was located in New Hampshire, seven in Massachusetts, two in Rhode Island, four in Connecticut, four in New York, nine in Pennsylvania (including three established in the early part of that year), two in Maryland, two in Virginia, two in North Carolina, three in South Carolina, and one in Georgia. The complete list is as follows:

The press of 1775.

A star (*) prefixed indicates that they were continued in 1812. Those marked thus (†) commenced in January, 1775; those marked thus (‡) in April, 1775.

Of these journals eight only were in existence in 1810, when Thomas' list was first published, many of them having suspended during the progress of the war, borne down by the circumstances upon which we have dwelt. Five additional papers, not here enumerated, were established during the first year of the war.

An attempt has been made to estimate the number of copies annually printed of the thirty-seven newspapers of 1775, which places the figure at 1,200,000. The aggregate is reached by the simple process of assigning to each of the papers an average weekly circulation of about 600 copies. This average is probably amply high, and calls for an average weekly issue of all the existing journals of less than 23,000 papers for a population of 2,800,000, in round numbers, or a paper once a week for every 122 individuals. Any value which these figures may be supposed to possess must be qualified by the fact that the great bulk of the revolutionary papers was circulated in the three cities of New York, Philadelphia, Boston, and their immediate vicinity.

Their probable circulation.

SECOND PERIOD: 1783-1835.

SECOND PERIOD.

AFTER THE REVOLUTION.

The close of the revolutionary war began the second era in the history of the American press, or the transitional era, as I have designated it. Up to this time it had taken firm root indeed, but in a soil which was sterile, where it survived as an exotic. The United States now entered upon an entirely different condition of affairs, the tendency of which was directly to stimulate the establishment of new journals in all the settled parts of the country and to supply them more adequately with the means of subsistence and growth, if not of large profits. As business enterprises, newspapers continued to be for many years uncertain and unattractive; and the circumstances which drew many men into the business, and tended to the continual multiplication of newspapers, were not of a kind to broaden their financial basis. (a)

Commencement of the transitional era.

POLITICAL PARTIES AND THE PRESS.

With the establishment of independence and the prolonged and exciting discussion which preceded the adoption of the federal Constitution the people of the United States divided quickly into groups upon issues which concerned altogether their own internal affairs, and engrossed the public mind in controversies, soon to become warm, which everywhere demanded methods of public expression and intercommunication. To this political stimulus may be directly traced the immediate multiplication of newspapers, and the fact that they rapidly attained a degree of influence hitherto unknown in America, and probably not previously paralleled in the world. (b) They were born of the friction generated by intense political feeling, and were very often established, under circumstances which foredoomed them to failure as business enterprises, by men carried away by intensity of political opinion or prompted to the venture by other men, who desired to make use of public prints for political purposes. The neutral and colorless journal, which had been so frequent before the revolution and during its progress, almost entirely disappeared, and of the three hundred and sixty-two papers which Thomas found in existence in 1810 all but seventeen were classified by him as attached either to the federalist or the republican party, most of the exceptions being either agricultural journals or periodicals of a literary character. The political opinions of a newspaper not only offered an inducement to subscribers of its manner of thinking, and thus spread the circulation among many who would not otherwise have taken it, but offered certain other advantages, such as the petty patronage in printing which political parties are able to supply and the favor, and frequently the sustenance, of politicians who were in positions of more or less power. Hence it happened that these early newspapers were divided in their political opinions very nearly in accordance with the well-known geographical distribution of politics in that era. Eleven only of the thirty-two journals published in Massachusetts in 1810 were republican in politics, only one of

The press and politics.

^a An episode in the life of Joel Munsell, of Albany, New York, affords illustration of the prevailing methods of newspaper publication even as late as 1827. In that year he was setting type on a weekly periodical, the *Masonic Record*, and to occupy the time when not thus employed young Munsell determined on issuing a newspaper himself. In one day along the principal business street he procured 150 subscribers. He purchased a small font of types and prepared for business. This paper was called the *Albany Minerva*, and was published semi-monthly on a half sheet folded as a royal octavo. The composition was done by Munsell in the back room of a bookstore, the use of which was paid for his attendance on customers while the clerk was absent at dinner. The paper was worked off at night on a Ramage press, with balls, in the *Record* office, and the next morning the editor himself delivered it at the doors of his subscribers. The labor involved in writing, type-setting, and press-work, all of which Munsell did himself, was so great that only eight numbers were issued, the first of which appeared January 1, 1828, when Munsell had not reached his twentieth year.—George R. Howell's *Memoir of Joel Munsell*.

Of the newspapers and periodicals printed or published by Mr. Munsell at various times there were, in addition, *The Microscope*, 1834, a weekly journal, which had for some time a considerable circulation, in the publication of which he was associated with Henry D. Stone; a daily whig campaign newspaper in 1840; a *Lady's Magazine* in 1842, edited by E. G. Squier; *The Northern Star and Freeman's Advocate* (1840); *The Spectator* (1844), a weekly religious newspaper, edited by Dr. William B. Sprague, which during the few years of its survival exercised a large influence in that portion of the state; *The Guard* (1845), an Odd Fellows' journal, of which C. C. Burr and John Tanner were editors; and, in subsequent years, *The State Register*, daily; *The Typographical Miscellany*, one of the earliest periodicals devoted to printing; *The New York Teacher*, the *Albany Morning Express* (1854), and the *Albany Daily Statesman*. Mr. Munsell was one of the committee appointed by the American Antiquarian Society of Worcester, Massachusetts, to edit and supervise the second edition of Thomas' *History of Printing*, published in 1874.

^b The newspapers of that day exercised an individual influence over the minds of their readers very far beyond that of the so much abler journals of our times. The power and influence of the press as a whole, and even the importance of the press as a political agent, have indeed greatly increased, but the effect which any individual journal can produce has very greatly diminished. In those days the *Aurora*, for instance, penetrated to many localities in which no other printed sheet ever made its appearance. There were many who never saw any other newspaper, and its falsehoods and calumnies produced all the effect natural to an uncontradicted statement of fact. At present the mischief that can be done by falsehood and misrepresentation is comparatively limited, detection and exposure following too close.—Hildreth's *History of the United States*, second series, vol. ii, p. 229.

the twelve papers in Connecticut, and correspondingly few in the rest of the New England states, throughout which the federalist party was strong. In Pennsylvania the political division of the newspapers at that time was very nearly even, while in Maryland, Virginia, the Carolinas, Georgia, Kentucky, Tennessee, and Ohio the federalist journals were as scarce as republican journals in New England. At an earlier date, and when these geographical party lines were more marked, this peculiarity was even more noticeable. At a date still later the fact that a federalist or republican newspaper existed in a certain town, either with or without being able to make a comfortable living there, was apt to prove the sufficient provocation for the establishment of another journal of the opposite politics. And thus they went on multiplying at a much more rapid rate, considering the relative population, the relative number of readers, and the facilities for distribution, than they have multiplied at any later date in the history of the country. In New York city especially journal after journal was established during the first quarter century after the revolution whose sole mission apparently was to advance the interests of one or another political faction existing there, and whose life went out when the faction disappeared, if indeed it did not cease before, and this process went on, only in less degree, in the other well-settled parts of the country.

The early journalism of this country, therefore, owes much, in one sense of the word, to politics, which may be said to have been the chief stimulus to its rapid spread for the first fifty years after the close of the revolutionary war, and until the close of the second era. It was natural that there should have been every inducement to

Geographical distribution of the political press.

repay the debt, and that politics should thus early have occupied the chief attention of the editors. It was a state of things which brought into the profession a class of men widely different from those who had been chiefly conspicuous in it during the colonial epoch. The majority of the

Multiplication of newspapers due to political causes.

latter were men of merely mechanical skill, more intent upon making a living out of their trade as printers than of consecrating their energies to a public cause. We have seen how the greater part of the writing done in the colonial press, either for or against the principle lying at the root of the revolution, was the work of outside contributors—of men who were themselves neither editors nor printers,

The editors of the second era.

but rather the leaders of opinion in their several communities, who were glad to embrace the opportunity the press afforded for influencing the public mind. The editor, in the sense that we now use the word, was not a frequent character, even in such newspaper towns as Boston, New York, and Philadelphia, and this was one chief reason why the pamphlet, rather than the newspaper, was so vital a literary force in the revolutionary epoch. The tracts of Thomas Paine attained a wider circulation throughout the colonies, and were more potent in the crystallization of public opinion, than all the issues of the periodical press. It was often the case that Benjamin Franklin, who is conceded to have been the best writer directly connected with the colonial press, while actively engaged in the publication and pushing of his journal, put the compositions he regarded as of the most importance in pamphlet form, in contempt of the claims of the journal which brought him his bread and butter, but whose files bear little evidence of his literary and intellectual characteristics. This was because he knew that he thus secured for them a wider circulation. The letters composing the *Federalist*, on the other hand, were supplied by their distinguished authors to the newspapers of New York city, and in these columns first exerted their powerful influence in behalf of the federal Constitution.

The post-revolutionary editors were frequently not printers at all, or they were printers who were also politicians. Some of them were men of conceded ability, whose writings were terse, pointed, and scholarly; others were men who made their points bluntly, and not always with that respect for the amenities of discussion which we are learning to regard as essential to the printed page. There were among them no trained journalists in the modern sense, and very few bold and strong intellects capable of dealing adequately with the large issues precipitated upon the young republic.

THE ALIEN AND SEDITION LAWS.

It is an historical fact that the men who were chiefly influential in giving its turn and tone to the American journalism of the period with which we are dealing were educated in other countries, and came to the United States without the training in American political affairs which native-born citizens had received by reason of the trials and restraints of the revolution, and without that respect for our young institutions which inured to the native. (a) William Cobbett was an English refugee; James Thompson Callender, of the Richmond *Examiner*, was an exile for seditious publication in Scotland; and William Duane,

Foreign-born editors.

^a The apology for the sedition act was the unquestionable licentiousness of the press, which at that time was chiefly conducted by refugees and adventurers from Great Britain and Ireland.—Appleton's *Cyclopedia*, xvi, 162.

At the time of the passage of the alien and sedition acts there were about two hundred newspapers published in the United States. Of these about one hundred and seventy-five were supporters of the national administration; the remainder were chiefly under the control of aliens. Although there were eight daily papers in Philadelphia and five or six in New York, it was seldom that any one had an editor distinct from the printer and publisher. One of the first papers established on that plan in New York was *The Minerva*, a daily paper, set up in 1794, of which the name had been lately changed to *The Commercial Advertiser*. It was the ablest paper in the country on the federal side, and was edited by Noah Webster, afterward the lexicographer. Out of New England the publishers of newspapers were principally foreigners. They were wielding a powerful influence by being vehicles for communication with the people by such men as Hamilton, Jay, Madison, King, Ames, Cabot, and many others; and in the half century between 1765 and 1815 this peculiar literature of America is to be found in its newspapers, sometimes coarse and vulgar, but always vigorous. From 1790 to 1800 the political newspapers—and they were nearly all such—teemed with scandalous personal attacks. Chief Justice McKean, in his charge in a libel case in which Cobbett was concerned, said in 1798: "Every one who has in him the sentiments either of a Christian or a gentleman cannot but be highly offended at the envenomed scurrility that has raged in pamphlets and newspapers printed in Philadelphia for several years past, inasmuch that libeling has become a national crime, and distinguishes us not only from all the states around us, but from the whole civilized world. Our satire has been

the editor of the famous *Aurora*, the anti-federalist organ in Philadelphia, then the national capital, had made a fortune once as the publisher of an English journal in India. Suppressed by the government, and petitioning in vain for redress, disgust and despair drove him to seek a new professional career in America, where he became, perhaps, the most violent and unseemly of the partisan editors. No epithet was so opprobrious that his types shrank from its use, and no federalist was too high to escape his constant and denunciatory attack. The republican principles of the elder Joseph Gales involved him in trouble with the English government, and he came to Philadelphia in 1793, where he became proprietor of the paper which formed the nucleus of the famous *National Intelligencer* when the capital was removed to Washington. (a) Cheetham, Gray, and Carpenter, New York journalists, were English immigrants since the revolution. There were enough of these foreign-born journalists among the editors of the period to give them prominence as a class, and the violence of their newspaper writing, while it was often equaled by that of the native writers, whether connected with the federalist or the anti-federalist press, was sufficient to occasion the agitation which culminated in 1798 in the passage of the alien and sedition laws. (b) While these laws were not nominally directed against the press, their enactment was largely due to the circumstances we have been relating, (c) and at once created a

The alien and sedition laws.

nothing but ribaldry and billingsgate; the contest has been who could call names in the greatest variety of phrases; who could mangle the greatest number of characters, or who could excel in the magnitude of their lies; hence the honor of families has been stained, the highest posts rendered cheap and vile in the sight of the people, and the greatest services and virtue blasted."—Lossing's *Cyclopædia of United States History*.

a The *National Intelligencer* was founded at Washington by Samuel Harrison Smith, and was first issued as a tri-weekly on October 31, 1800. Joseph Gales became connected with it in 1807, and continued its editor until his death, in 1860. In 1812 he took into partnership his brother-in-law, William W. Seaton, by whom the journal was edited until 1865. It was issued as a daily from 1813 to 1869, when it was discontinued.

b The influence upon American politics exercised at this moment (1812), and for nearly twenty years previously, by a small body of educated and enthusiastic foreigners was indeed very remarkable, and may well serve as a caution to the nations of Europe. The demand for printers and editors, especially in the middle states, could not be supplied from domestic sources, and as many of these political exiles had been connected with the press at home, many of them, indeed, having been driven into exile in consequence of publications prosecuted by the government as libelous or seditious, they had adopted the same calling in America. Converted thus into mouthpieces of the democratic party, they obtained and exercised an influence out of all proportion either to their number or their talents. Randolph complained that almost every leading press in favor of war was conducted by men who had but recently escaped from the tyranny or the justice, whichever it might be, of the British government. He gave as instances the *Aurora* and the *Democratic Press*, the leading papers at Philadelphia, edited, the one by Duane and the other by Binns; the *Whig*, at Baltimore, conducted by Baptiste Irving, and the *Intelligencer*, at Washington, by Joseph Gales.—Hildreth's *History of the United States*, second series, iii, p. 217.

c The second section of the sedition act, as embodying the only legislation of the Congress of the United States which can be said to have been directed against the liberty of the press, is here reproduced:

And be it further enacted, That if any person shall write, print, utter, or publish, or shall cause or procure to be written, printed, uttered or published, or shall knowingly and willingly assist or aid in writing, printing, uttering, or publishing any false, scandalous and malicious writing or writings against the government of the United States, or either house of the Congress of the United States, or the President of the United States, with intent to defame the said government, or either house of the said Congress, or the said President, or to bring them, or either of them, into contempt or disrepute; or to excite against them, or either or any of them, the hatred of the good people of the United States, or to stir up sedition within the United States, or to excite any unlawful combinations therein, for opposing or resisting any law of the United States, or any act of the President of the United States done in pursuance of any such law, or of the powers in him vested by the Constitution of the United States, or to resist, oppose, or defeat any such law or act, or to aid, encourage, or abet any hostile designs of any foreign nation against the United States, their people or government, then such person, being thereof convicted before any court of the United States having jurisdiction thereof, shall be punished by a fine not exceeding \$2,000, and by imprisonment not exceeding two years.

A *Dissertation upon the Constitutional Freedom of the Press in the United States of America*, by "An Impartial Citizen" (known to have been James Sullivan), Boston, 1801, contains an elaborate discussion of the relations of the government to the press in this country, and presents in judicial form the legal objections to the sedition act as they appeared at that time, and as forcibly as they have been stated in any subsequent publication. We quote the body of Mr. Sullivan's argument:

"The remedies for libels are on a civil process or on indictment. The former is by an action upon the case for damages. In this action the plaintiff sues in his private capacity, as a private citizen, and can make no use of any public official character he may sustain, excepting merely in aggravation of damages. The courts where such actions are to be litigated are the same as those where any action for breach of contract or other civil injury may be maintained.

"The remedy or redress on an indictment is on a different footing. There, unless the national Constitution has changed it, the prosecution is to be, not only in the state, but in the county where the offense is committed. The indictment cannot be for a libel simply against a public officer. The description of the offense may be aggravated by a malicious intention in the party charged to deprive the party libeled of offices or honors; but still it is no more an offense against the government in kind, even though the libels are against the officers of the same, but must remain within the jurisdiction of the state governments, because the party injured, although he is an officer of the federal government, yet remains a subject of and under the protection of the state where he resides. This will appear to be exclusive on a review of the powers given to the Congress of the United States.

"None of these powers seem to include the authority to punish libels, and therefore some very good men have their doubts whether the general government can make laws on this subject.

"It is very clear that, considering a libel as a private injury, the Congress can have no authority to enact a law for its definition or punishment. But yet it does by no means follow that a libel may not be so conceived and published as to be a crime against the government itself, independent of the personal injury done to the particular subject of it, and when that is the case the government ought to possess the power of punishing it on the principle of preserving the Constitution.

"Any laws which may be necessary to the carrying into effect the powers vested in the national government may be enacted by the Congress; but if there is no government, or no Congress, there can be no laws made. It is therefore necessarily implied that all things which ought to be done to preserve and maintain that government which is vested with those authorities, and which may make laws for their execution, may make laws to preserve its own existence. Should it be said that the state governments will preserve and defend the existence of the federal government this would by no means be accepted as an answer, because a government depending on another government for its existence is merely a corporation; it can have no sovereignty, and can be no bond of union for a nation.

"The late act of Congress was deficient in its principles on these essential points. It went beyond what the Constitution would warrant. Some of the libels pointed out by the act were such as were written and published against the President to bring him personally into disrepute or contempt, or to excite against him personally the hatred of the people.

"The Constitution of the United States has expressly provided that crimes shall be tried in the state where they shall be committed;

great counter-excitement throughout the United States. There were about two hundred papers published at the time in the whole country, (a) and it was believed that from twenty to thirty of these journals, which were

and that in civil actions for damages, where one of the parties is a citizen of a state of which the other is not a citizen, the action may be commenced and prosecuted in a court of the United States, at the election of the parties. There is in this provision no distinction in persons or officers. When the general government was formed the people might, if they had thought it proper, have made provision for a President, Vice-President, and all the officers of the general government to bring their suits and prosecutions in the federal courts; but no such provision was made. Perhaps the reason was that the general government is as much the government of the people as the others, and must derive its support from the same source.

"The character of the first magistrate of the nation is highly to be respected; and though it may not be safe in any keeping but that of the federal government, yet, as the Constitution has not placed it there, a question on a legal principle does not arise on the subject. Those who are advocates for the late act of Congress against libels may feel themselves hurt at these observations, and may endeavor to support their measure by arguments supposed to result from powers necessarily implied in the Constitution. Their arguments will be before the public, and I am without anxiety at the event, be it what it may; for I am ready to receive and abide the public judgment. It has been said that the power of self-preservation is an incidental, constituent part of the government, because a national government must be a sovereign government of course, and a sovereignty relying on another sovereignty for civil support is an inadmissible idea in politics; but it will by no means follow that the right to vindicate the President's personal character against libels is necessarily incident to the Constitution. The want of personal character in a chief magistrate would be an unfortunate circumstance, but governments have existed very frequently and very well under this difficulty. Should the President bring a civil action for a libel or other slander, he would stand on the same level with other actions, and have his trial by the same rules and in the same courts where they have theirs. Should there be a criminal prosecution for a libel published against him personally, it could not be prosecuted anywhere but in the state courts and in the county where the offense happens. But if the libel is pointed at him personally, and yet written, printed, or published with an intent to injure, oppose, or subvert the government of the United States, it takes a new denomination of criminality, and becomes punishable, of necessity, in the judiciary of that government against which the crime is committed.

"The argument that the Congress have a right to protect the character of the President would with the same propriety be extended to every officer and servant of the general government. There can be no government without officers, and there can be no government without subjects and property. The case with us is: whether right or wrong must remain under the process of experiment; that we have from a number of separate sovereign states carved out a national general sovereignty, limited as to its authority, over the same persons and the same property as the state governments have in protection, and what power is not expressly or by a necessary implication given to that is retained to the several states. Had the Congress enacted that if any person should print, write, or publish any libel against the President or either house of Congress, with an intent to obstruct, injure, oppose, or subvert the government of the United States, or to raise sedition against the same, he should be punished, etc., it would have described a new offense, which ought to be punished by that government. But when they enact that when any person shall publish a libel, with an intent to defame the said President, or to excite against him the hatred of the good people of their states, without connecting it with an intent to injure the government, it will be difficult to maintain the measure by the Constitution.

"It may be said that the injury done to the President may be an injury done to the United States. That may or may not be true; and it may be said that libels against the judges and other servants of the public are injuries to the government. Nay, every immoral and vicious thing is an injury to the nation; but the creators of the federal government are the creators and the supporters of the others, and are equally interested in all, and did not choose to invest the general government with all the authority claimed in the late sedition law, passed by the late Congress.

"This observation will, no doubt, be made, and be echoed and re-echoed from one champion to another, that if the federal government cannot protect their President from libels, but must send him to the state courts for defense, we had better give up the national system at once. This observation, when made, will be the result of the want of consideration. A moment's reflection will evince that the general government is supported by the same people who support the others; that these will have their influence; and whenever the general government shall be guided by men who shall attempt a separate interest the public opinion will gradually remove them, until the connecting balance shall be restored to its constitutional perfection. The sum of the argument, on the whole, is this:

"That the constitutional freedom of the press does not open the flood-gates of slander on the members of the civil society and allow each man to calumniate his neighbor with impunity.

"That a man's reputation ought to be guarded as of the next consequence to his life.

"That whatever is in fact done by a government, or by any officer of it, in his official capacity or under a pretense of official authority, may be published to the world without the writer or printers being chargeable for a libel.

"That the reputation of men in office is as dear to them as that of other citizens is to them, and as much under the protection of the laws as the reputation of men in private life is; and that, therefore, a charge against them of bribery or corruption ought not to be published otherwise than in a judicial prosecution against them before a proper tribunal, where they may be removed from office or otherwise punished, according to the demerit of their crime.

"That where a man appears as a candidate for an elective office he exhibits his character for a public scrutiny, and every one has a right to publish anything against his election which is not false in fact, but must be answerable for all falsehoods and groundless slanders, as well in civil as in a criminal prosecution.

"That though every one has a right to publish the proceedings of the government in all its departments, yet, if the publications are made of measures which have never happened, the writers and printers are amenable, provided that any injury is done, or may be done, to the government by it. The fact of writing or publishing being proved, the burden of the proof rests on the defendant to prove the truth of the facts published, which, if he cannot do, he must submit to punishment, unless he can show that it was innocently done from mere error and mistake.

"That though no one can justify the false publication of facts in regard to the measures of the government, yet, if facts are truly published, no one can be punished for reasoning erroneously upon them, or for publishing his reasons, however wrong he may be in his conclusions.

"That the general government, having the power of punishing libels against the government itself by a necessary inference from the Constitution, does by no means give it the power of punishing those which are published against its President or other officers, who are also the subjects of the state governments, unless the libel is made and published with an intent to injure the government itself, which intent must be averred in the indictment and be found by the traverse jury, or jury of trials; otherwise he cannot be convicted. As this distinction most plainly results from the Constitution, there can be no doubt but that every candid, sober man will be ready to give it a full force in his mind, because, were whatever he may with the Constitution, he must be content to take it as it is.

"And, finally, that a reasonable constitutional restraint, judiciously exercised, is the only way in which the freedom of the press can be preserved as an invaluable privilege to the nation."

a This number is given by Hudson. Thomas says that in 1800 there were "at least one hundred and fifty publications of this kind printed in the United States". Hildreth states that the exact number is unobtainable, but that it considerably exceeded one hundred.

violently opposed to the administration of John Adams and its measures, were edited and controlled by aliens. A number of prosecutions occurred under these acts, among the most conspicuous being that of Abijah Adams, of the *Boston Chronicle*, who was indicted on the plea that he sold the papers—he being a bookkeeper in the establishment—which contained libels on the legislature of Massachusetts. Adams was found guilty of “publishing only”, and was sentenced to thirty days’ imprisonment in the county jail, to pay the costs, and to give bonds for good behavior for one year. Some of the most conspicuous of the prosecutions were brought, not against journalists, but against prominent politicians. Such a case was that of Matthew Lyon, a representative in Congress from Vermont, who was indicted and convicted in 1798 on the charge of having written a letter to the publisher of a Windsor newspaper “abusing in a most virulent manner the President and Senate of the United States”, with the intention “to stir up sedition and bring the President and the government of the United States into contempt”. Charles Holt, publisher of *The Bee*, printed at New London, Connecticut, was found guilty of defaming the President and discouraging enlistments in the army, and was sentenced to three months’ imprisonment and a fine of \$200. (a) James T. Callender, editor of the *Richmond Examiner*, was tried for a libel on the President, and was sentenced to nine months’ imprisonment and a fine of \$200. There were a number of other convictions under the sedition law, but just how many there is no means of ascertaining, and many were not of editors or publishers of newspapers. (b)

Convictions under the sedition act.

There can be no doubt that these laws were meant to be, and were, a restriction upon the liberty of the press in the United States, and that, as such, they were wholly repugnant to the popular judgment and feeling. The alien and sedition laws, instead of effecting the purposes at which they aimed, undoubtedly increased the intensity of the partisanship of the American press, and there was less of this kind of journalism, although still plenty of it, after they ceased to be in effect. However that may be, the laws stand as the only effort ever made by the government of the United States to take direct cognizance and regulation of the utterances of the political press, and were altogether the result of the peculiar and critical politics of the time, when the government was untried and good men actually feared that it was within the power of an unrestrained press to endanger its perpetuity by undermining the popular confidence in its *personnel*. (c) The fierce partisanship of the press of that era was the reflex of the public mind itself, and it cannot be said of these editors that they were any worse or any better than the people who read their writings and delighted in their gall and wormwood. But as time passed there came, gradually but surely, an improvement in the tone and character of the American press.

Causes and effects of these laws.

Of the journalism of this period, considered from a professional point of view, it is not possible to speak in high terms. Among the editors of that day were many men of great versatility and of marked intellectual gifts. Much of the political writing was powerful, and there can be no doubt that it exercised marked and continual influence upon the public mind, frequently leading public opinion, and sometimes determining important political results. Of journalism in the professional sense there was little, if any. (d) By this is meant that the business of making a newspaper had not yet come to be regarded as a profession distinct and clearly defined in itself, and was not pursued by those who sought it with a view to making it such a profession, men of all pursuits, if they had any literary tastes, regarding themselves as qualified, without any special training or experience. It frequently happened that they linked it to other occupations, and as the earlier editors had been booksellers and stationers, the later ones were lawyers, *litterateurs*, ministers, or business men. The profits of most newspaper ventures were small, and, as a necessary consequence, the remuneration given to men who were employed as editorial writers and managers was uniformly meager. An

Little professional journalism.

a Charles Holt, publisher of *The Bee*, incurred a fine of \$200 under the sedition law in 1800, which Congress, nearly half a century afterward, repaid him, principal and interest.—Munsell’s *Typographical Miscellany*.

b The following quotation, from Henry S. Randall’s *Biography of Thomas Jefferson*, fairly represents the view of the sedition law generally taken by the anti-federalists at the time:

“It has been said that the victims of the sedition law were few. We do not know the number, but they were surely enough for the purposes of intimidation. * * * When we look at the cases and decisions under our sedition law of 1798 we cannot fail to become convinced that its aim and intent were not to prevent or punish real sedition—actual, open, or secret machinations against our institutions and laws. Its manifest object was to shield the federal government from damaging censure, to arm it with power to put down political opposition; in a word, to confer on it authority during its shorter political tenure about equivalent to that then possessed and exercised in political affairs by the government of Great Britain.”

c Franklin, in the second part of his autobiography, written about the time of the close of the revolution, alludes to the scrupulous care he always exercised to prevent the insertion of objectionable matter in his journal; and, commenting upon the changed tone of the American press, he adds: “Now many of our printers make no scruple of gratifying the malice of individuals by false accusations of the fairest characters among themselves, augmenting animosity even to the producing of duels, and are, moreover, so indiscreet as to print scurrilous reflections on the government of neighboring states, and even on the conduct of our best national allies, which may be attended with the most pernicious consequences.”

d On the subject of the personal and literary character of the journalists of this epoch there can be no better authority than Mr. Thomas, who knew personally so many of them and so many of their colonial predecessors. In his *History of Printing* Mr. Thomas quotes with approval some remarks from Miller’s *Retrospect of the Eighteenth Century*, in the course of which it is said: “In the earlier part of the century talents and learning at least, if not virtue, were thought necessary in the conductors of public journals,” to which Mr. Thomas adds the comment: “This has not been generally so much the case in America as in Europe. From the earliest period too many of our gazettes have been in the hands of persons who were destitute both of talents and literature. But in later times the number of editors who fall under this description has become greater than formerly.”—II, 203.

accurate impression of the character of the business and the manner of its conduct, especially in the smaller cities and towns, is given in the following extract from an address containing some account of the early history of the *Providence Journal*:

In and about the year 1820, although there were as many newspapers as the community required, there was no systematic and well-managed journalism. A printer and publisher, for the purpose of extending his business, put forth proposals and issued a subscription for a new paper. If the number of subscribers was, in his opinion, sufficient to pay the expense, he engaged a person to edit and supervise the paper. At that time literary labor of this description was so meanly compensated that no lawyer, physician, or schoolmaster would undertake the business for merely the monetary remuneration. In the case of the first editor of the *Journal* there was no demand or stipulation for pay. That person saw the necessity of a sacrifice by some one for the advancement of great public interests, and he consented to a temporary supervision of the *Journal*. A reference to the early files of that paper, now in the editorial library, will enable you to estimate the amount of labor bestowed. It was almost exclusively in the night season that the *Journal* was edited, as a relaxation from the daily labors of another profession, and it was understood from the beginning that so soon as the *Journal* could be considered as securely established another editor should be procured. At the end of the first year the name of the editor was omitted from the imprint in consequence of the increase of professional business, but he continued for several years thereafter an informal oversight of and contribution to its columns, for which, and for all previous labors, he received the sum of \$500.

DE TOCQUEVILLE ON THE AMERICAN PRESS.

It is easy, familiar as we are with the journalism of the present day, to belittle the comparative excellence of that out of which it grew. An impartial and contemporaneous opinion is therefore desirable, and has been furnished in the admirable treatise of M. Alexis de Tocqueville on *Democracy in America*, written in 1835. M. de Tocqueville was amazed during his travels through the United States at the progress of the press, and says:

The number of periodical and occasional publications which appear in the United States actually surpasses belief. There is scarcely a hamlet which has not its own newspaper. The facility with which journals can be established induces a multitude of individuals to take part in them; but as the extent of competition precludes the possibility of considerable profit, the most distinguished classes of society are rarely led to engage in these undertakings. But such is the number of the public prints, that, even if they were a source of wealth, writers of ability could not be found to direct them all. The journalists of the United States are usually placed in a very humble position, with a scanty education and a vulgar turn of mind.

From this severe commentary the eminent Frenchman turns to a discussion of the methods and the influence of the American newspaper, and continues:

The will of the majority is the most general of laws, and it establishes certain habits which form the characteristics of each peculiar class of society. The characteristics of the French journalist consist in a violent, but frequently an eloquent and lofty manner of discussing the politics of the day, and the exceptions to this habitual practice are only occasional. The characteristics of the American journalist consist in an open and coarse appeal to the passions of the populace, and he habitually abandons the principles of political science to assail the characters of individuals, to track them into private life, and disclose all their weaknesses and errors.

And yet again:

The personal opinions of the editors have no kind of weight in the eyes of the public; the only use of a journal is that it imparts a knowledge of certain facts, and it is only by altering or distorting the statement of those facts that a journalist can contribute to the support of his own views.

In contrast with the harshness of this generalization and the conclusion, elsewhere reached, that "the power of the press is much greater in France than in the United States", M. de Tocqueville concedes, "notwithstanding this limitation of the resources of the press," that "its influence in America is immense. It is the power which impels the circulation of political life through all the districts of that vast territory. Its eye is constantly open to detect the secret springs of political designs, and to summon the leaders of all parties to the bar of public opinion. It rallies the interests of the community round certain principles, and it draws up the creed which factions adopt, for it affords a means of intercourse between parties which hear and which address each other without ever having been in immediate contact. When a great number of the organs of the press adopt the same line of conduct their influence becomes irresistible; and public opinion, when it is perpetually assailed from the same side, eventually yields to the attack. In the United States each separate journal exercises but little authority, but the power of the periodical press is only second to that of the people".

THE TYPICAL NEWSPAPERS OF THE PERIOD.

The best representatives of the American political press in this peculiar and formative period were: On the federalist side, the *Columbian Centinel*, established in Boston in 1784 by Benjamin Russell, and conducted by him for a period of forty years; the *New England Palladium*, begun as the *Massachusetts Mercury* in 1793, by Alexander Young and Samuel Etheridge; the *Minerva*, established in New York in 1793, long ably edited by Noah Webster, and the nucleus of the present New York *Commercial Advertiser*; the New York *Packet*, which had survived the Revolution and was shortly thereafter made a daily by its enterprising publisher, Samuel Loudon; the New York *Evening Post*, established in 1801, under the auspices of Alexander Hamilton, John Jay, and their political associates, and continuing its uninterrupted publication down to the present day; in Philadelphia, *Peter Porcupine's Gazette*, established in 1792 by that restless and vehement English agitator, William Cobbett; the *Connecticut Courant*, the *Salem Gazette*, and others of lesser influence. On the republican side the most influential journals were located at Philadelphia while it remained the seat of the federal government, and were the *Aurora*, established in 1790 by Benjamin Franklin Bache, (a) and edited after his death by William Duane, and the *National Gazette*, established in 1791 by Philip Freneau, while

a See ante, page 5.

employed under Thomas Jefferson in the State Department. In New York the leading republican newspapers were *Greenfield's New York Journal*, a continuation of Holt's ante-revolutionary *Journal*, and rechristened about the beginning of the century the *American Citizen*, when it was edited by James Cheetham; the *Morning Chronicle, Gazette* that Edes and Gill had founded, the chief pillar of the revolutionary cause in New England, but espousing the losing side in the debate upon the Constitution and expiring in 1798; the *Independent Chronicle*, established in Boston in 1776, in the midst of the revolution, and until the close of the century the leading New England organ of the Jeffersonian school of politics; and the Boston *Patriot*, established in 1809, consolidated with the *Independent Chronicle* in 1817, and published as a daily until its absorption in the Boston *Advertiser* in 1831. The Richmond *Enquirer*, founded in 1804 by Thomas Ritchie, was a potential organ throughout the South.

Of all these journals Russell's *Centinel* may be accepted as the best type of the early political newspaper of the United States. During the greater part of its existence the *Centinel* was meager, fragmentary, and ill-arranged in its news and trivial and provincial in its original matter; but its blows were steady and heavy. Russell delighted in ingenious devices to attract attention, and pictures, curious mechanical arrangements of type, reckless displays, capitals and punctuation marks, and extravagant allegories and travesties in prose and verse were his constant resort to supplement his argument. After the election of Washington to the presidency the *Centinel* grew steadily in position and influence, and in spite of its constant and disgraceful personalities won great prosperity, and deserved it. Russell drew around him the most eminent federalist writers of America, and during the later years of his proprietorship his paper became an epitome of the history of the world. Mr. Buckingham is probably not too strong in praise when he says of it:

Russell's *Centinel*.

As a vehicle of useful and accurate intelligence the *Centinel* secured to itself a reputation superior to that of any other American newspaper. Russell had a peculiar mode of condensing and arranging the contents of foreign journals and presenting in the most readable shape all the incidents then (1790-1815) agitating Europe. Through the whole of this period, and for some years afterward, the *Centinel* was an indispensable source of news for the country printers, every one of whom relied upon it for matter to fill up the news department of his paper. Subscribers in the country also increased beyond all precedent. It was everywhere known and everywhere read, and if industry in collecting and fidelity in republishing information that was important to be known are worthy of credit never was popularity more honestly earned. (a)

One of the most praiseworthy journalistic ventures of this era—the one which, on the whole, has been of greatest service to the history of the country—was *Niles' Register*, established as a weekly at Baltimore in 1811 by Hezekiah Niles, who published it until 1836. The *Register* was from week to week and year to year a repository of the documentary and political history of the country, reported with an impartial fidelity which modern journalism may emulate but cannot surpass, and it attained a national circulation, because it supplied, with a degree of fullness not attempted by the local journals, the details of the political progress of the country. *Niles' Register* is now the most frequently quoted periodical in the works of writers upon American history, and its value as a reference record was so well understood at the time that Mr. Niles republished the series in thirty-six volumes. This publication was continued by his son, W. O. Niles, until June 27, 1849, making a series of seventy-six volumes in all. A journal just like the *Register* would not be a successful undertaking in these days, for the functions peculiarly its own have been absorbed by the daily and weekly press, and are by them discharged with the same fidelity. The *Register* finally disappeared, not because its usefulness was ended, but because the service it rendered was discharged by other journals, which also did other service to which it could not attain.

Niles' Register.

Partisanship and personality continued in the American press throughout the entire second era in its history, and continue to-day, constantly breaking out in assaults upon personal character and motives as malignant and disgraceful as anything that degraded the files of the earlier journals. The great mass of the newspapers of the United States continued to be conducted in the interests of one or the other of the existing political parties, and still continue to be so conducted, and they will so continue for an indefinite time to come. It is neither unnatural nor improper that this relationship should exist. The free press is the vehicle through which the public seeks and finds its political expression, and the undue partisanship which is the inevitable result of such close association is largely counteracted by the nearly equal division of the American press in its political associations. As journals grow stronger in their financial basis they come to be conducted as business enterprises of other kinds are conducted. The dependence upon political connection ceases to be essential to existence, and thereafter ceases to work the unfortunate results which undoubtedly attended the first establishment of this relationship.

The partisan press.

With the development of the country other functions of the newspaper began to have at least an equal importance with its partisanship, and so, imperceptibly almost, to modify the character of the journalism of the United States. There came an extraordinary increase of business, and the field of the newspaper expanded correspondingly, its columns being more and more sought as a medium of business communication and announcement. As their numbers increased the newspapers felt the vitalizing

Enlarging field of journalism.

influence of competition and began to rival each other in the promptness and fullness with which they gathered the news of the day. The first daily newspaper made its appearance. This was the *American Daily Advertiser*, of Philadelphia, in 1784. (a) The second daily newspaper, the *New York Daily Advertiser*, appeared in New York the year following. Boston followed with a daily, the *Polar Star and Boston Advertiser*, in 1796, and it failing, with the *Federal Gazette and Daily Advertiser* in 1798. The names adopted by these first experiments in daily journalism were significant of an early recognition of the important field for money-getting which lay all undeveloped in the matter of advertising.

Up to this time the advertisements of all existing papers had been a wholly minor feature of their columns. On the other hand, the attention given to maritime and commercial intelligence was slight and fitful; but soon after the revolution advertisements began to be an equal source of revenue with subscriptions, and the prices charged for them increased correspondingly. The development of this feature of American newspapers was so sudden and extensive that British journals commented with surprise upon the comparatively extensive advertising patronage of the journals printed in the large cities of the United States.

It is true of the early publishers that they dedicated their earnings to the improvement of their publications, so that both in typography and in the amount and character of the reading matter published they steadily improved.

RECORD OF THE EARLY PRESS.

It is impossible to trace the growth of newspapers during this second period with anything like statistical accuracy, owing to the failure of the journals of that era to record this development in their columns and of any one else to make record of it. Mr. Thomas, who preserved the greater part of the data we possess regarding the colonial press, brought his record nominally down to the year 1810, in which his *History of Printing* was published. The one hundred and fifty journals of whose existence he was aware in 1800 had increased in these ten years to three hundred and sixty-six, or more than double—a ratio of increase quite as remarkable at that time as the ratio discovered in the last census year, when more papers were established and more died than the whole number in existence in 1810. His list of American journals in 1810 is here reproduced, as the most important contribution that has or can be made to the literature of the journalism of that period. It has been supplemented, so far as possible, with a record of the subsequent history of the journals enumerated by him:

NEW HAMPSHIRE (12 papers).

[f. Federal republican; r. republican, opposed to the federalists; n. neutral; w. weekly; s.w. semi-weekly; t.w. tri-weekly; *published before the revolution.]

*1 period of issue not given included in total.

†1 occasionally and 2 period of issue not given included in total.

The untrustworthiness of these figures for circulation in 1810 will be seen from an analysis of New York. There were seven dailies printed in that city in that year, and if we assign to them the entire 4,139,200 given the state as an annual circulation we reduce their average daily issue for 310 times a year to 1,907 and leave not a sheet for the sixty other papers then printed, of which eight were semi-weekly. Indiana is given one paper, with 15,000 issues, which means, apparently, 288 papers a week for fifty-two weeks.

This list omits, of course, a large number of periodicals which were established in the interval since the close of the war, and which had ceased to exist in 1810. Of this class of journals there were quite as many, in proportion to the whole number, as there have since been at any period. Quite a large list of them might be given, but inasmuch as it must be incomplete the effort has not been made. Dailies, weeklies, semi-weeklies, and tri-weeklies were constantly being started, especially in cities like New York and Philadelphia, during this period. Leaving out of the account all that failed or were absorbed by more successful enterprises, we find that there were in 1810 seven dailies in New York city, nine in Philadelphia, five in Baltimore, two in Charleston and one in Georgetown, South Carolina, two in New Orleans, and one in Alexandria, making twenty-seven dailies then published. We can trace through other sources the upward progress of the daily press in New York city in the years immediately subsequent, and the figures given below indicate the proportions of circulation to population, not only for that city, but with comparative accuracy for each of the other large cities of the United States. They are obtained from the *Newspaper Record*, compiled by Lay & Brother, of Philadelphia, with the assistance of W. T. Coggeshall, then state librarian of Ohio, in 1856, a work which is not only valuable as supplying the only connecting link with Thomas' history, but noteworthy also as being the first attempt to publish a complete newspaper directory of the United States:

At the date when these figures begin there were undoubtedly more daily newspapers circulated in London than in New York city, but the difference closed up rapidly with the lapse of years, until in 1850 the number printed and sold in New York had grown to be nearly double the number in London.

New York and London
daily press.

While the daily press of the large cities was thus developing the weekly newspaper was pushing itself throughout the country wherever the stalwart enterprise of the period blocked out new villages and settlements. (a)

These weekly newspapers partook largely of the characteristics of the earlier weekly papers of the metropolis, and were modeled after them in appearance and contents. The first newspaper in the Mississippi territory had appeared in 1779. In 1793 the *Centinel of the North-Western Territory* was started in Cincinnati by William Maxwell, the first newspaper and the first printing office beyond the Ohio river. Nathaniel Willis, a Boston printer, established the *Scioto Gazette* in Chillicothe in 1796, and in 1799 the *Western Spy and Hamilton Gazette* was issued. The first periodical publication in Indiana territory appeared at Vincennes in 1808, and in the same year the *Missouri Republican* was founded at Saint Louis, then a small trading-post. Kentucky had seen her first newspaper in 1787 at Lexington, under the auspices of John Bradford, and in 1809 Michigan had a small paper, published half in English and half in French, at Detroit. The record of the establishment of these and other pioneer papers is given in detail, so far as obtainable, in the appendix to this report, containing a summary statement of the development of the press in the several states of the United States. The daily newspaper began to make its appearance in the larger provincial towns between 1815 and 1830, the Albany *Daily Advertiser* being founded in 1815, and the Rochester *Daily Advertiser* in 1826. In 1832 there were in New York state, outside of the metropolis, but seven daily papers, (b) three of which were printed in Albany,

a The publication of this paper commenced within less than thirty months after the first blow was struck in laying out our village of Moscow. The place was then a thicket of wood, without a human habitation. At present we have a flourishing settlement, in which many useful arts and professions are exercised, and three schools established, at which the number of scholars is nearly eighty.—*Genesee (N. Y.) Farmer*, 1817.

b Coggeshall in *Newspaper Record*, 1856.

SECOND PERIOD: 1783-1835.

47

two in Troy, and two in Rochester. In 1824 there were eleven daily papers in Philadelphia and twelve in New York, with a circulation varying from 1,000 to 4,000 copies. In 1828 the whole number of the American press had increased to 863, with a yearly issue of 68,117,798 copies. In 1830 the number was estimated at 1,000, while the census of 1840 returned 1,403 newspapers and periodicals, with a yearly issue of 195,838,673 copies. The following table, also compiled by Mr. Coggeshall, conveys at a glance the progress of the American press from 1776 to 1840, at which latter date the third era of journalism in this country may be said to have been well under way:

States.	1776.	1810.	1828.	1840.
Maine			29	36
Massachusetts	7	32	78	91

THIRD PERIOD: 1835-1880.

THIRD PERIOD.

PREVIOUS FEDERAL AND STATE CENSUSES OF THE NEWSPAPER PRESS.

This sketch of the rise and development of the American newspaper has now reached the period of time which marks the commencement of the third and present era in its history. It is not possible to assign the beginning of this era to any particular year or event, its coming being due to a variety of causes, which may be enumerated in the following order: First, the establishment of the penny press; second, the development of railroads as a means for the distribution of newspapers, the transmission of news reports, and the reduction of heavy postage rates; third, the discovery of telegraphy, and its immediate application to the purposes of journalism; and fourth, but not less important than other causes, the improvements of the printing press, which have rendered it possible to print large editions of newspapers in a short time.

Causes of the present development of the American press.

The contrast between the primitive journalism of the United States and that which may be taken as typical of its present development is wholly in keeping with the general growth of the country. It has passed from a desultory and hap-hazard pursuit into a well-organized, thoroughly-equipped, and largely-remunerative business and profession combined, which employs the best brains, reaps the amplest rewards, and exerts an influence somewhat vague perhaps in its character and of disputed potency as compared with other mediums of influencing public opinion, but still a force recognized in every quarter as of the highest importance in the political, social, and material progress of the country. Considered merely in its statistical aspects, the condition of the American newspaper press at this culminating period in the third era of its history indicates a growth which has no parallel in any other country in the world, and is hardly paralleled by that of any other phase of industrial development in the United States. The significance of these statistics is immensely enhanced by the peculiarly intimate relation the periodical press bears to every other field of development in our civilization. It has made itself the exponent and the reflex of every other industry and profession. There is now no field of thought or labor which does not command its special organs of opinion and information, adapted to the varying conditions of different latitudes and conflicting interests. Underlying this remarkable development of the press we cannot fail to recognize, as a self-evident proposition, the necessary dependence of the community upon the newspaper press for the discharge of certain functions which society requires at certain hands, and upon the discharge of which the well-regulated daily life of the people depends. The conditions of this daily life require some general medium of communication between man and man. Thus, notices of marriages and deaths, business announcements of every conceivable description, official publications and notifications required by law, an infinite variety of details, of both public and private character, relating to the mails, the trains, the churches, the schools, etc., all these have come to depend upon the periodical press for publicity. The expedients of primitive society for supplying the place of this press were many and unique, but were confessedly inadequate, even in a primitive society. The press has thus wound itself around the very pillars of our institutions, and its own growth is an inseparable consequence of growth in every other direction. Quite as much to this necessary and increasing relation of the periodical press to the development of the country as to either of the four causes enumerated above must be assigned the explanation of the important and interesting condition in which the newspaper is found at the Tenth Census.

The press a public necessity.

The influence of the various causes enumerated in the rapid growth of newspapers in this country will be considered in their turn in the presentation of the statistics elicited by the Tenth Census in reference to the newspaper press, and in the elucidation of these statistics it will frequently be necessary to reach backward and pick up the scattered threads of history which underlie the present condition of the American press. But the year 1880 finds both the newspaper and the periodical press in the fullest development of the characteristics of this third era, and the various features of newspaper growth for the past forty years can therefore be most advantageously traced in connection with the statistics now to be discussed.

Plan of the discussion.

A large part of the information presented in the series of tables submitted herewith has never before been gathered, either in a census or in any other form. Cognizance was first taken of the newspaper press as a subject of specific investigation in the federal census of 1840, the census of that year containing an enumeration of the newspapers and periodicals then published, with an approximation of their circulation. Subsequently there was some effort on the part of private individuals to gather in a rough form the number of papers published in the United States, their characteristics, and their approximate circulation, and these figures have been gathered together in this report, with a view to showing the gradual development of the American press. Several of the states in their state censuses have made a special feature of the statistics of the press; but comparatively so few of them have any state census at all, and of those which do so few have devoted any attention to this branch of

Earlier censuses of the American press.

State censuses and the press.

investigation that it has been found impossible to make any general use of their figures by way of illustrating this development. The census of New York taken in 1865 contained an alphabetical list of all the newspapers and periodicals published in that year in the state, together with a summarized estimate of their circulation; and the next and last census, that of 1875, ignored the press altogether as a subject of investigation. The Massachusetts census of 1875 gave a list of all the newspapers published in that state in the year previous, with a series of accompanying tables, which indicated their number, their character, and their circulation by periods of issue. The report of the secretary of the state of Ohio, published in 1877, contained a full list of all the newspapers, serials, and other periodicals published in that state in the year previous, but without any statistical data accompanying it. The Wisconsin "Blue-Book", of annual publication, contains each year a list of the newspapers and periodicals of that state; so also does that of Michigan. The first annual report of the bureau of statistics of the state of Indiana (1879) contains the most complete attempt yet made by the authorities of any state to compile the statistics of its newspaper press. The figures obtained from these various state reports are summarized in the appendix to this report. The first biennial report of the board of agriculture of the state of Kansas (1877-'78) contains a carefully-prepared history of the newspapers published in the several counties, without statistical data regarding them. The data given include the number, circulation, politics, and general character, number of employés, and amount paid in wages of all the newspaper establishments in the state.

The above includes all that has been done, so far as I am able to discover, by any of the states toward the collection of the statistics of the newspaper press. It is a field of inquiry so easily covered, and the statistics to be elicited are subject to such constant and interesting variation, that it seems proper to suggest that in all state censuses hereafter attempted special attention should be given to this subject of investigation. Accurate lists of the newspapers published in the several states are of great value to many individuals for a variety of purposes; and they constitute, beside, a very material element in the history of the state. The newspapers have come to rank side by side with the schools, the churches, and the libraries as an educating and elevating influence in society, and differ from these civilizing institutions only in the sense that they are private enterprises. But they are alike dependent upon public support, sustaining an official relation to the civil institutions, and attaining in every locality the character and the influence which make them, all things considered, the best possible index of the real character of the communities they represent.

DEFECTS OF PREVIOUS CENSUSES OF THE PRESS.

In the two decades intervening the methods of inquiry concerning the press by the federal census mainly followed the plan adopted in the census of 1850. The statistics were gathered by the regular enumerators in the course of their collection of population and industrial statistics, and included only the data of the number of periodicals, their circulation, the character of the several publications, and the periods of issue. The census of 1840 had a series of tables devoted to the printing and binding industry. The statistics of the newspaper press, as regards number and periods of issue, given in that census have been reproduced elsewhere. In addition to these figures, the census of 1840 gave 447 binderies, and to these and 1,552 printing offices (which included the newspaper establishments) assigned 11,523 hands employed and \$5,873,815 capital invested. There was no attempt to estimate the value of the gross product, although this was done for other industries, and there has been no effort in subsequent censuses to estimate the amount of capital invested. In the Eighth and Ninth Censuses there were given in the tables of the manufacturing statistics approximate figures for the printing industry in bulk, embracing newspapers, book and job printing, under separate heads, in the Eighth Census, and grouping all branches, with the addition of photographic albums, in the Ninth Census. (a) The most casual examination of these tables, either in the Eighth or the Ninth Census, shows them

‡ Value of products in 1850, \$11,586,549; increase 1860 over 1850, 168 per cent.

to be unreliable as an indication of the real status of the printing industry in the years covered. The value of the newspaper product in 1860 was placed at \$20,653,371, which was claimed to be an increase from \$11,352,705 in 1850; and the total value of all the printing products enumerated above, as grouped in the Ninth Census, was returned as \$66,469,000, as against a total by the Eighth Census, exclusive of photograph albums, of \$39,678,043. If the figures for 1860 were abnormally small, as the importance of the combined industry at the time would indicate, those given for 1870 were utterly inadequate to determine the dimensions of the printing business at that time. The present inquiry has discovered the value of the gross product of the newspaper establishments alone to be \$87,441,132 22, and if to these figures is added the value of the products of all the book publishing establishments and job-printing offices in the United States the grand aggregate would approximate \$150,000,000. Great as has been the advancement in all the industries relating to printing, it can hardly be pretended that, except in the single branch of newspapers, the value of their product has doubled in the ten years.

Incompleteness of earlier press statistics.

PLAN OF THE PRESENT INQUIRY.

In enlarging the field of inquiry the aim has been to gather all the facts in relation to the press which will aid in determining its proper rank among the various industries which invite the investment of American brains, capital, and enterprise; which will be of service to the craft itself in studying the conditions of business success; which will afford the parties who supply the material wants of the publishers—the paper manufacturers, the press-makers, and the type-founders—a correct knowledge of the quantity of those supplies in use or likely to be used hereafter; and which, finally, may be required to estimate something of the educational influence of the press of the United States as a steadily progressing medium of intercommunication and self-education between and for the masses of the people.

Aim of this inquiry.

The pursuit of several inquiries to this end has been attended with numerous and perplexing difficulties, and some illustrations of these difficulties may be given. The great majority of the newspapers of the United States are published in connection with a job-printing office, upon which the publishers rely as an equal source of revenue. This is invariably the case with the weekly local newspapers, which constitute the bulk of the American press of to-day. As a rule, the publishers of these newspapers keep no separate accounts of the outgo and income from these two sources of revenue. Many of them, in filling out the schedules sent them for the statistics of their newspaper publication, returned to the Census Office the figures for the newspaper and the job-printing industry combined, and to detect when this had been done, and to make the proper separation when necessary, was a delicate and difficult undertaking. The task can be somewhat simplified in future censuses by consolidating every inquiry which relates in any manner to the printing and publishing business under one investigation and arranging the schedules sent out, with a view to assisting the party making answer in the classification of the details of his double industry.

Difficulties encountered.

Job printing and newspaper publication.

Another difficulty arising in the preparation of these statistics was to draw a clearly-defined and intelligible line between publications of a permanent character and those which are in their nature ephemeral and unjournalistic. There is an immense number of publications in the United States of the latter character, hundreds of presses constantly producing them for a myriad of purposes. It may be said, in a word, that they have been rigorously excluded from this enumeration, as they embrace all the devices of advertisers to push their wares by incorporating in their advertising sheets a certain amount of attractive reading matter and emitting them at regular dates, like *bona-fide* periodicals. There is not a city in the United States which does not possess more or less of this class of periodicals, and in drawing the line between them and those which should be enumerated the rule adopted was to exclude all publications which are not sold at a stated subscription price. Publications which are distributed gratuitously to whoever will take them are not newspapers or periodicals in the real sense of the word, because their purpose is the business advantage of the publisher in other than journalistic fields, their continuance being dependent upon his caprice, rather than upon any fixed rule of periodic appearance. These include all such issues as theater programmes, the bulletins of large mercantile houses, transient political campaign sheets, and the large fashion quarterlies of ladies' furnishing houses, of which latter there are many which would seem, under any other rule, to properly belong in the census enumeration. Publications of the kind indicated are in the nature of things ephemeral. They appear and disappear with an intermittent regularity which defies enumeration, and confuses the real and important character of the American press.

Ephemeral publications.

The rule of exclusion adopted.

The census of 1870, in speaking of this difficulty, said:

The law requires this report of newspapers and periodicals, on account of their relation to the moral, social, and intellectual condition of the people. To swamp this class of statistics by inconsiderately admitting hundreds of prospectuses, circulars, and advertising sheets, which can possibly have no such relations, would be undoubtedly an abuse. At the same time this subject has been treated liberally, and every periodical has been admitted to these tables which could establish a reasonable claim to be considered as within the purview of the census act.

The rule of exclusion adopted in this inquiry is founded upon the rulings of the Post-Office Department of the United States, which excludes all publications not here enumerated from mail-matter of the second class, and includes newspapers or periodicals mailed from a known office of publication. (a) The rule of the Post-Office Department is based upon reason and equity. It would have been possible, by including in this enumeration the publications which the Post-Office excludes from second-class mail, to swell the volume of American newspapers fully one-third above the figures given in this report. They add largely to the importance and the revenue of the printing business as such, but they add nothing to the influence of the press in its capacity as a medium of news communication, and cannot rightly be permitted to enter into an inquiry of this character.

The ruling of the Post-Office.

a The following general rules, published by the Post-Office Department for the purpose of obtaining uniform decisions in regard to the character of publications entitled to be mailed at the second-class rate, indicate the principles upon which the department bases its definition of a periodical:

DOUBTFUL PUBLICATIONS.

1. Trade journals which are manifestly not devoted to the general interests of the whole trade which they assume to represent, and do not admit all reputable firms or houses upon equal terms to their advertising columns, but publish the price-list or other advertisement of one house, to the practical exclusion of all others in the same line of business, must be regarded as primarily designed for advertising purposes, and hence should be excluded from the pound rate allowed to second-class mail-matter.

2. When, however, the owner of a publication of this character can offer satisfactory evidence to the postmaster at the office of publication that it possesses sufficient value in the opinion of the public to induce a large enough number of subscriptions by persons who do not advertise in it and have no interest in the advertisements therein as to make the publication self-sustaining and a source of profit, independent of the benefits conferred upon the business, either of the proprietors, when they are not regularly engaged in the sole business of printing and publishing, or of the houses whose price-lists or other advertisements are published therein, then the department holds that, in the judgment of the public, the publication is originated for the dissemination of information of a public character, and the presumption against it being thus removed, it may be admitted to entry as second-class mail-matter; but this evidence must be submitted in detail to the First Assistant Postmaster-General for his ruling as to its sufficiency.

3. Publications asserted to be issued in the general interest of printers and publishers cannot be admitted to entry as second-class mail-matter when it appears that the number of their paid subscriptions is so insignificant in comparison with their exchange lists as to demonstrate that the primary object of the publishers is to advertise their own business and that of others by means of a free circulation among other publishers and printers. The assumption by the proprietors of such publications that they are entitled to the pound rate doubtless originated in a misunderstanding of the effect of the acts of June 23, 1874, July 12, 1876, and March 3, 1879. Under the act of June 8, 1872, it was enacted:

SEC. 184. That the following mail-matter shall be allowed to pass free in the mail:

* * * * *
Seventh. Newspapers, periodicals, and magazines, reciprocally interchanged between publishers, and not exceeding sixteen ounces in weight, to be confined to a single number of each publication.

The act of June 23, 1874 (section 5), prohibited free exchanges, and fixed the rate of postage upon "all newspapers and periodical publications mailed from a known office of publication or news agency, and addressed to regular subscribers or news agents", at two cents per pound when published once a week or oftener, and at three cents per pound when published less frequently.

This was modified by the act of July 12, 1876 (section 15), which provided:

That transient newspapers and magazines, regular publications designed primarily for advertising purposes, or for free circulation, or for circulation at nominal rates, shall be admitted to and transmitted in the mails at the rate of one cent for every two ounces or fractional part thereof, and one cent for each two additional ounces or fractional part thereof.

The act of March 3, 1879, which fixed a uniform second-class rate of two cents per pound, contains the following proviso to section 14:

Provided, however, That nothing herein contained shall be so construed as to admit to the second-class rate regular publications designed primarily for advertising purposes, or for free circulation, or for circulation at nominal rates.

The rate of two cents per pound does not cover the cost of transportation, but was agreed to by Congress in accordance with the uniform policy of the United States government from the first inception of the postal system, which has been to favor the diffusion of intelligence among the people by throwing upon the general public a large portion of the cost of carrying legitimate newspapers and periodicals to subscribers.

The acts of July 12, 1876, and of March 3, 1879, show, however, that it was not the intention of Congress to permit the liberal rates of postage, given for the purpose of encouraging the diffusion of intelligence by legitimate publications, to be abused for the mailing of mere advertising sheets at the expense of the public; and there is nothing in the law to induce the belief that Congress proposed that advertising regularly among their customers or prospective patrons at the pound rate, while it prohibited a wholesale grocer from sending a publication descriptive of his goods in the same manner and at the same rate to all retail dealers.

4. The rule just indicated for the exclusion of so-called printers' publications, designed primarily for the purpose of free exchanging, should also be applied to so-called "amateur" publications, and the same evidence of a self-sustaining subscription-list required of them as of trade journals before admission to entry as second-class mail-matter.

* * * * *
6. The list of legitimate subscribers to entitle a publication to entry as second-class mail-matter must be composed of those persons only who themselves make and pay their subscriptions.

7. The regular sale to news agents of the whole or greater part of the issue of any publication is sufficient evidence that it has a legitimate list of subscribers.

8. After a publication has been admitted to entry as second-class mail-matter, the regular mailing by the publisher of sample copies in quantities exceeding the number sent to regular subscribers, as well as the continuous mailing of such copies to the same person, will be taken as evidence that it is primarily designed for free circulation, and its transmission at the second-class rate should be discontinued.

9. If one number of the current issue of a publication which has been admitted to the second-class rate be so changed as to assume the character of an advertising sheet within the intent of the statute, and be fraudulently mailed as second-class mail-matter, or presented for mailing at the pound rate, the right of the publication to the second-class rate is thereby destroyed, as it cannot be said to "regularly be issued at stated intervals". It cannot again be admitted to the pound rate until its regularity of publication as second-class mail-matter is re-established.

ALMANACS AND ANNUAL PUBLICATIONS.

For the same reason no effort has been made in this inquiry to make a record of the annual publications in the United States. Such an effort was made in the censuses of 1850 and 1860, and abandoned in that of 1870. The census of 1850 reported four annual publications, with a circulation of 47,500; that of 1860 sixteen annuals, with a circulation of 807,570. Exactly what kind of periodicals these were it is impossible now to discover; but it is obvious from the large figures given for circulation that they were in the nature either of literary or holiday annuals, of which there have been at various times many and excellent ones published in the United States, or of almanacs, of which there always have been, and still are, very many more. The literary annuals, once so popular, can be more properly classified as books, which in fact they are, and they appear once, twice, or oftener, as they are profitable or otherwise. Of the almanacs there are an immense number and variety in the United States, which are sold at a stated price, beside the innumerable quantity published by individual enterprise for gratuitous distribution as a successful method of advertising. These almanacs, and particularly those of a political character, like the *New York Tribune Almanac*, the *Albany Evening Journal Almanac*, and the *Philadelphia Ledger Almanac*, as well as those of a religious character, published either by religious organizations or newspapers, are in the nature of serials, but they are for a purpose and of a character apart and distinct from the character and purpose of periodical publications, and to admit them into the enumeration would therefore have simply been confusing. Another reason for not admitting them appeared in the impossibility of obtaining, with the resources at the command of the Census Office, an accurate enumeration of the whole number of these almanacs now published in the United States and sold at a stated price. New enterprises of this character constantly appear and disappear again after a single publication. The history and statistics of almanacs in the United States offer an inviting field of investigation, but not in connection with the statistics of the newspaper press. (a)

Annual publications.

Almanacs.

^a The annals of almanacs in America begin with the first introduction of printing in the new world north of Mexico. In 1639 appeared at Cambridge *An Almanac Calculated for New England*, by Mr. William Pierce, Mariner. This was printed by Stephen Daye, and no copy of it has been preserved. It was the first book printed in the colonies, preceding by a twelvemonth the famous *Bay Psalm Book, or New England Version of the Psalms*, published by the same printer at Cambridge in 1640. Cambridge continued to issue almanacs almost every year, and in 1676 the first Boston almanac was printed by John Foster, who published the same year the first book ever printed in Boston. The first Philadelphia almanac was put forth in 1686, edited by Daniel Leeds and printed by William Bradford. New York followed with its first almanac in 1697, by J. Clapp. Samuel Clough issued his first almanac in Boston in 1700, which was continued until 1708, under the title of the *New England Almanac*, a copy of which for 1703, a dingy little book of twelve leaves, measuring three and a half inches by five and a half, is before us. The title is as follows: "The New England Almanac of the Year of our Lord MDCCIII. Being Third after Leap Year, and from the Creation, 5652, discovery of America, by Columbus, 211, Reign of our Gracious Queen Anne (which began March 8, 1702), the 2 year. Wherein is Contained Things necessary and common in such a Composure. Licensed by his Excellency the Governour. Boston, printed by B. Green and J. Allen, for the Booksellers, and are to be sold at their Shops. 1703." The second page bears the traditional and repulsive wood-cut professing to show what parts the moon governs in man's body, corresponding to the twelve signs of the zodiac. The weather predictions are curious. For April 26 is foretold "misling weather mixt with some dripling showers". The eclipses of the year 1703, "in the judgement both of Divines and Astrologers," are supposed to portend "great alterations, mutations, changes, and troubles to come upon the world". The "Comet or Athereal Blaze" seen in 1702 is said to have led to "bloodshed, droughts, clashing of armies, and terrible diseases among men".

Of almanacs which have been published in long series in this country the following list embraces some of the more notable: Nathaniel Ames' *Astronomical Diary and Almanac*, started at Boston in 1725, and continued more than half a century, about 60,000 copies of which were sold annually; Titan Leeds' *American Almanac*, Philadelphia, 1726; T. Godfrey's *Pennsylvania Almanac*, begun in Philadelphia in 1729; *Poor Richard's Almanac*, by Richard Saunders (Benjamin Franklin), continued by others as *Poor Richard Improved*, Philadelphia, 1733-1786; *Father Abraham's Almanac*, by Abraham Weatherwise, Philadelphia, 1759-1799; Nathaniel Low's *Astronomical Diary or Almanac*, Boston, 1762-1827; Isaiah Thomas' *Massachusetts, Connecticut, Rhode Island, New Hampshire, and Vermont Almanac*, Worcester, Massachusetts, and Boston, 1775-1822; R. B. Thomas' *Farmers' Almanac*, Boston, 1793-1877; the *Massachusetts Register and Almanac*, Boston, established by Mein and Fleming, 1767-1877; Webster's *Calendar, or the Albany Almanac*, 1784-1877, the oldest family almanac continuously published extant in the United States; Bickerstaff's *Boston and New England Almanac*, 1768-1814, continued as Bickerstaff's *Rhode Island Almanac*, Providence, 1815-1877; *Poor Will's Almanac*, Philadelphia, 1770 to 1840, or later; the *Virginia Almanac*, Williamsburgh and Richmond, 1751 to 1829, and later; the *South Carolina and Georgia Almanac*, Charleston, 1760 to 1800, and later; *North American Calendar*, Wilmington, Delaware, 1796 to 1844, and later; Dudley Leavitt's *New England Almanac*, Exeter and Concord, New Hampshire, 1797 to 1877; Thomas Spofford's *Farmers' Almanac*, Boston, 1817 to 1845; John Gruber's *Town and Country Almanac*, Hagerstown, Maryland, 1822 to 1877; the *Maine Farmers' Almanac*, by D. Robinson, Hallowell, 1818 to 1877; Daboll's *New England Almanac*, New London, Connecticut, 1777 to 1877; and Allen's *New England Almanac*, Hartford, 1806 to 1833, or later. Many of these almanacs are preserved in private families, though but few are to be found in our public libraries. It was an early habit in New England to preserve the almanacs from year to year, carefully stitched together, and to annotate them frequently with family records or current events. The generally worthless character which has been attributed to the English almanacs of the last century must be modified as regards some of the American family almanacs. Benjamin Franklin, the illustrious printer and statesman, is justly declared by a French encyclopædist to have put forth the first popular almanac which spoke the language of reason. In truth, the homely maxims and pithy, proverbial counsels of *Poor Richard*, although not all originated by Franklin, constitute to this day a breviary of life and conduct admirable in some respects for the use of the young.

In the later days of the American revolution the almanacs put forth by Nathaniel Low at Boston, price "4 coppers single", contained political articles vigorously defending the liberties of the people, and exerting a great influence at the New England fireside in inspiring young and old with the love of freedom.

Virginia was early in the field with *Warne's Almanac*, printed at Williamsburgh in 1731. The first almanac printed in Connecticut

THE PRESS SCHEDULES.

In arranging for the collection of all the information desired regarding the newspaper and the periodical press it was decided to send out but two sets of schedules, one of which was prepared with especial reference to the daily press and papers published adjunct thereto, and the other for all classes of publications of a periodic character. (a) The daily press, notwithstanding its comparatively small number, is such an enormous interest—equal nearly in its gross product to the product of all the other

The schedules adopted.

was issued at New London in 1765 by T. Green. The first Rhode Island almanac was issued at Newport in 1728 by James Franklin, and the first Providence almanac by Benjamin West, in 1763. The first in Maryland of which we have any trace appeared at Annapolis in 1763.

Of agricultural and medical almanacs, the latter an outgrowth of the present century, the name is legion. Comic almanacs appear to have been first published in the United States about 1834, and have had an enormous circulation. Of the religious or denominational almanacs, the *Church Almanac* of the Protestant Episcopal church was begun in 1830; the *Catholic Almanac and Directory* (continued under various names to the present time) in 1833; the *Methodist Almanac* in 1834; the *Universalist Register* in 1836; the *Baptist Almanac* in 1842; the *Congregational Almanac* in 1846; the *American Unitarian Register and Year-Book* in 1846; the *Presbyterian Historical Almanac* in 1858; and the *Family Christian Almanac* in 1821. Most if not all of these are still continued annually.

The class of political almanacs, or almanacs issued by public journals, began with the first *Whig Almanac*, issued by Horace Greeley in 1838, continued since 1855 as the *Tribune Almanac*. The chief feature of this publication has been its full tables of election statistics. The *World Almanac* was first issued in 1868, and the New York *Herald Almanac* in 1872. The *Evening Journal Almanac*, of Albany, dates from 1860, and the *Public Ledger Almanac*, Philadelphia, from 1870. Many other journals, east and west, publish annual almanacs.

Of more extensive publications, under the name of almanacs, published in this country the *National Calendar*, edited by Peter Force, was the prototype. This work was published at Washington from 1820 to 1836 (with a three-years interval from 1825 to 1827, when no calendar was issued), and was a useful official register of the government, with abstracts of public documents and other valuable information. The *American Almanac and Repository of Useful Knowledge*, first published at Cambridge, Massachusetts, in 1830 (two years after the first issue of the *British Almanac*), was continued annually under various editors and publishers till the year 1861, when the publication ceased. This carefully-edited publication embodied much astronomical and meteorological information, that department frequently extending to one hundred pages. The official statistics of Congress and the general government and of the various states, with a chronicle of events and obituary notices, made up the remainder of the work. The *United States Almanac, or Complete Ephemeris*, edited by John Downes, appeared at Philadelphia for the years 1843, 1844, and 1845. It was nearly one-half made up of astronomical matter and tables, valuable chiefly to those versed in the higher mathematics. The *National Almanac and Annual Record* for the years 1863 and 1864 was published at Philadelphia by George W. Childs, and contained a vast amount of useful and thoroughly-digested information. The *American Year-Book and National Register*, edited by David N. Camp, appeared from the Hartford press for the year 1869 in an octavo of 824 pages, and was the most extensive attempt to combine a work of general information and reference with the calendar which the country has seen. It has not been continued.

Many almanacs are printed in this country in foreign languages. The pioneer of the German almanacs was issued by Sower, of Germantown, Pennsylvania, in 1738, and continued by him and his successors to the present day. Franklin's *Poor Richard's Almanac* was translated into German by A. Armbruster, who was in partnership with Franklin from 1754 to 1758. German almanacs are now printed and circulated in large editions in nearly all the middle and western states of the Union. In French, the *Almanack Français des États Unis*, established in 1848 in New York, is still published.—Ainsworth R. Spofford, in the *American Almanac* for 1878.

a These schedules were as follows:

(1) DAILY JOURNALS, INCLUDING WEEKLY, SEMI-WEEKLY, OR TRI-WEEKLY PAPERS CONNECTED WITH THEM.

[The publisher will please send to the Superintendent of Census, in inclosed wrapper, one copy of the daily paper, and one copy of weekly or other journal connected therewith, of date nearest to July 4, 1880. The journals received in response to this request will be classified, bound, and deposited in the Smithsonian Institution, to constitute a complete and permanent memorial of the newspaper press of the United States.]

1. Name of journal and place of publication, with the county and state.
2. State whether morning or evening.
3. State whether a Sunday edition is published.
4. State if a weekly, semi-weekly, or tri-weekly paper is published in connection with the daily.
5. State the general scope and character of the journal.
6. If published in a language other than English, indicate what language.
7. Date of original establishment of the journal.
8. Names of the journals, if any, merged or consolidated with it since its original establishment.
9. Subscription price of daily, ———; weekly, ———; semi-weekly, ———; tri-weekly, ———.
10. Price of each paper per single copy.
11. The average circulation per issue of the daily during the census year ending June 1, 1880:
Of the weekly, ———; of the semi-weekly, ———; of the tri-weekly, ———.
12. Aggregate number of copies printed and circulated during census year: Of the daily, ———; weekly, ———; semi-weekly, ———; tri-weekly, ———.
13. State the percentage of the circulation of each which is sold within the city or town of publication.
14. Value of the annual products in dollars, ———.
15. Total number of persons employed in manufacture: Male, ———; female, ———.
16. Number employed in editorial and reportorial work, ———.
17. Amount annually paid in wages, ———.
18. State the percentage of receipts from advertising and from subscriptions: From advertising, ——— per cent.; from subscription, ——— per cent.
19. Average number of ems of type set to each issue of daily.
20. Number of pounds of type required for uses of the journal.

periodicals in the United States combined—that the distinct and separate inquiry regarding it was wholly justified, and it was rendered necessary in the acquisition of accurate figures by the fact that from the greater number of daily newspaper establishments there issued other papers, adjunct thereto (weeklies, semi-weeklies, and tri-weeklies), constituting a class of papers of peculiar features, never before separately reported in a census. The general inquiries relating to all other periodicals were of such uniform character as to warrant the belief that the single schedule would suffice for the weekly village newspaper and the staid metropolitan quarterly, leaving the separation into classes to be done in the Census Office proper. The results of the inquiry have shown that this belief was well founded, the simpler method avoiding much confusion and mistake. Both classes of schedules sent out were returned with remarkable promptness and fullness from nearly every section of the Union, and if the information given was not always accurate, the error was generally obviously due to the lack of definite information on the part of the publisher, and experience in handling the returns enabled revision to be easily and accurately made.

Separate inquiry regarding the daily press.

21. Number of presses in use, with names, character, and capacity of each.
22. Horse-power of engines.
23. Size of sheet and number of pages.
24. Average number of pounds of paper used for each edition of daily, ———; weekly, ———; semi-weekly, ———; tri-weekly, ———; number reams for each, ———.
25. State if stereotype plates are used in printing.

(2) JOURNALS AND MISCELLANEOUS PERIODICALS OTHER THAN DAILY.

[The publisher will please send to the Superintendent of Census, in inclosed wrapper, one copy of his journal or periodical of date nearest to July 4, 1880. The newspapers and periodicals received in response to this request will be classified, bound, and deposited in the Smithsonian Institution, to supply a complete and permanent memorial of the periodical press of the United States.]

1. Name of publication.
2. Town, county, and state in which published.
3. How often published.
4. State the general purpose and character of the publication.

The following classification is suggested, with the expectation that periodicals not properly coming under either head will indicate their scope and character specifically under (18) Miscellaneous.

- | | |
|---|---|
| 1. News and family reading. | 11. Law. |
| 2. News and politics. | 12. Science and mechanics. |
| 3. Religion and theology, with denominational relations, if any. | 13. Freemasonry, odd fellowship, temperance, etc., including the publications of societies. |
| 4. Agriculture, horticulture, stock-raising, dairy, etc. | 14. Education and history, including the periodicals of educational and historical societies. |
| 5. Commerce and finance. | 15. Society, art, music, and fashion. |
| 6. Trade journals generally. | 16. College and school periodicals. |
| 7. Insurance, railroads, etc. | 17. Children's periodicals, including Sunday-school papers. |
| 8. General literature, including monthly and quarterly magazines. | 18. Miscellaneous. |
| 9. Sunday newspapers. | |
| 10. Medicine and surgery. | |

5. Date when the periodical was established.
6. Give the names of periodicals, if any, consolidated with it since original establishment.
7. Average circulation per issue during census year ending June 1, 1880.
8. Aggregate number of copies printed during census year.
9. What percentage of the circulation is sold within city or town of publication.
10. Subscription price.
11. Price per copy.
12. State the percentage of receipts from advertising and subscriptions: From advertising, ——— per cent.; from subscriptions, ——— per cent.
13. Gross value of the annual product in dollars.
14. If published in a language other than English, state what language.
15. State if the periodical is regularly illustrated.
16. State whether the publishers do their own printing, in whole or in part.
17. If so, the name, character, and number of presses in use.
18. Nature of power employed, and what horse-power.
19. Average number of ems of type set to each issue.
20. Number of pounds of type required for uses of the periodical.
21. Size of sheet or page, and number of pages.
22. Average number of pounds of paper used to each issue, ———; number reams, ———.
23. State whether stereotype plates are used.
24. Number of persons employed in manufacture: Male, ———; female, ———.
25. Number of persons employed solely in editorial work.
26. Amount paid annually in wages.
27. If publishers do not do their own printing, please state name and address of printing-house employed.

Publishers of weekly newspapers, in responding to the inquiries of this schedule, will confer a favor by adding, in the space below, the names of any periodicals that may have been established or suspended within the town or immediate vicinity during the census year ending June 1, 1880.

Some defects in the method of inquiry other than as noted above have been suggested during the preparation of these statistics; but there seems good reason to believe that by the results obtained the way has been prepared and the basis established upon which it will be possible hereafter to present in complete and intelligible form all the details in regard to the decennial progress of the newspaper press which it will be of advantage to know.

NUMBER AND DIVISION OF THE NEWSPAPER AND PERIODICAL PRESS.

The first of the tables submitted with this report shows that there actually existed during the census year 11,314 periodical publications of all kinds in the United States. Of these, 971 were daily newspapers; 8,633 were weekly newspapers and periodicals, of which number 804 were weekly editions of daily journals; 133 were semi-weekly newspapers, of which 41 were connected with daily newspapers; 73 were tri-weeklies, of which 41 were connected with dailies; 40 were bi-weekly publications; 1,167 were monthly periodicals; 160 were semi-monthly periodicals; 2 were tri-monthly periodicals; 13 were bi-monthly periodicals; 116 were quarterly periodicals; and 6 were semi-annual periodicals.

The division of these publications into their several classes, as well as the division by periods of issue, is indicated in this table; and in this regard attention is called to the fact that all journals which, in strict phraseology, are newspapers are grouped under the general heading of those devoted to "news, politics, and family reading". To this group belongs the entire daily press, all of which was devoted primarily to the dissemination of the news, political, commercial, and general, with varying specialties in a number of cases, as also the great bulk of the weekly publications, whose mission it is to supply their readers with the local news of their several communities, a *résumé* of the general news of the world for the current week, with other departments of miscellaneous or family reading matter. The majority of these weekly newspapers are identified with one or the other of the existing political parties, and all of them discuss political questions more or less, though in many cases from the standpoint of a neutral or independent journal. All the semi-weekly and tri-weekly newspapers belong in this group, as do a few of the bi-weeklies, semi-monthlies, and monthlies. None of the remainder have any title to be regarded as newspapers, being classed as periodicals, magazines, and other publications, which appear at stated periods, and are concerned with other interests than the mere publication or discussion of the news. This distinction between the newspaper and the periodical is drawn sharply in the English press directories, and is a just and proper one to be made by the census. Dividing the American press in accordance with it, the 11,314 publications reported resolve themselves into 8,863 newspapers and 2,451 periodicals. The latter are classified in Table I according to their general purposes, and have been divided for convenience into the following fourteen classes: Religious journals (553 in number); agricultural (173); commercial and trade, which includes market journals (284); financial journals (25); insurance and railroad journals (54); general literature, which includes not only the monthly and quarterly magazines, both literary and critical, but also the weekly family story papers, etc. (189); medical and surgical journals (114); law journals and digests (45); journals relating to science and mechanics (68); journals which advocate temperance, or are the organs of organizations like the freemasons, odd fellows, etc. (149); educational journals, including college and school publications (248); journals devoted to society, art, music, and fashion, including ladies' journals (72); children's periodicals, including Sunday school papers (217); and miscellaneous, under which latter head were grouped a heterogeneous assortment of papers (260 in number) too infinitely subdivided in their objects to warrant separate classification, and covering almost every phase of life, study, or pursuit not embraced in the above classes. The 481 illustrated papers reported are included in one or another of the above classes, as are also the newspapers or periodicals published in the German or other languages than the English.

It is evident that the development of periodical literature in the United States has not been less remarkable than that of the newspaper proper.

COMPARATIVE RATE OF NEWSPAPER INCREASE.

Table XI has been prepared with a view to showing at a glance the actual number of newspapers published at the time of the taking of each of the four last censuses, the increase between 1870 and 1880 being enormous, reaching almost 100 per cent. It has long been evident to those who have given the matter attention that the last decade has been exceptional, not only in the history of the United States, but of the whole world, in the multiplication of printing presses. It has witnessed the rehabilitation of the newspaper press in the southern states, as well as a healthy rate of growth there, and an almost reckless audacity among the pioneer printers of the great and growing West. Even in long

and thickly-settled states like New York and Massachusetts the increase is quite as remarkable, being in the former nearly one-third, and in the latter nearly one-half.

The most notable increase reported is in the direction of the weekly newspaper press: an increase which was in such rapid progress at the time this census was taken that it was difficult, and indeed impossible, to trace all the new establishments that properly belonged in the enumeration of the census year. The actual number of new journals reported of all classes as established within the census year is given at 1,127, which is 10 per cent. of the whole number. Deducting from this number the 833 suspended papers, we find the net increase of the year to be 294. This increase in the census year is 2.60 per cent. of the total number of papers published in 1880. The actual increase in the number of papers published in the census year over those published in 1870 is 92.71 per cent., and the increase in their circulation in 1880 over that reported in 1870 is 52.48 per cent. The rate of increase indicated in previous censuses was as follows:

	Number of new papers established; ratio of increase.	Comparative rate of increase in number and circulation.
Increase in number, 1870 over 1860		Per cent.
Increase in number, 1860 over 1850		44.93
Increase in circulation, 1870 over 1860		60.37
Increase in circulation, 1860 over 1850		52.54
		165.71

As a basis for estimating the future growth of the American press, the increase given for the census year, namely, 2.60 per cent., may be safely taken as the lowest ratio of annual increase that will prevail during the ensuing ten years.

SUSPENSION AND CONSOLIDATION OF NEWSPAPERS.

The statistics of the establishment and suspension of new publications have such an important bearing upon the stability of the American press that they have been made the basis of a special table (VII), in which the existing press is grouped by decades in respect to age. It appears from this table that 5,429 of the 11,314 journals of 1880 were established between 1870 and 1880, 1,731 between 1860 and 1870, 903 between 1850 and 1860, 1,216 in all previous years, and 117 with no date given. A simple calculation will show that, of the 5,871 journals reported in the census of 1870, 1,904 must have since suspended publication, and by comparing this number with the number of journals that suspended in the census year 1880 (833) we can form some idea of the large number of newspapers that must have been both established and suspended during the course of the decade, no record of which appears in either census.

One column in Table VII reports 1,640 as the number of consolidations represented in existing journals, and sheds light upon an important aspect of journalistic development in the United States. The consolidation of rival newspapers and periodicals in fields that prove not sufficiently nutritive for both is constantly in progress. As a rule, the stronger absorbs the weaker, and, as the latter may frequently be the journal of earlier establishment, it happens that many existing papers claim a date of establishment much earlier than that which witnessed the first publication under their titular designation, the titles of the absorbed papers being frequently retained as a secondary caption, more especially if they indicate an earlier date of establishment. There are a number of existing journals each of which represents all that remains of from half a dozen to a dozen periodicals. (a)

^a The history of the *Boston Daily Advertiser* is such a curious illustration of the fact in question that it is here reproduced complete, as recently stated in the columns of that journal. There is some confusion in regard to several links in the chain, owing to the carelessness with which early files have been preserved, but the following is as accurate as it can be made:

1. The *Essex Gazette*, founded in Salem August 2, 1768, by Samuel Hall, was moved to Cambridge in the summer of 1775. Mr. Hall continued the publication there, under the title of the *New England Chronicle or the Weekly Gazette*. The following year, 1776, at the close of the siege, the place of publication, with the press and types, was moved across the river. The property and good-will was bought by Powars & Willis, who changed the title in November of that year to—

2. The *Independent Chronicle and Universal Advertiser*. The new publishers disposed of their interest in 1783 to (Thomas) Adams & Nourse, who continued the *Chronicle* semi-weekly until May, 1800. It then became the property of (Abijah) Adams & Rhoades, the latter being the editor until his death, in 1819. The *Chronicle* was then sold to Ballard & Wright, and united with—

3. The *Boston Patriot*, established in 1809 by Everett & Monroe, a supporter of Madison's administration and of the war of 1812. The two papers being united, were published daily under the title of the *Independent Chronicle and Boston Patriot* until 1831, when they were bought by Nathan Hale and merged with the *Daily Advertiser*.

4. The *Columbian Centinel*, started as the *Massachusetts Centinel and Republican Journal* in March, 1784, was owned by Mayor Benjamin Russell, publisher and editor from 1786 to 1828, when he retired, disposing of the property to (Joseph T.) Adams & Hudson. Two years later, 1830, the new proprietors bought—

5. The *New England Palladium*, and continued its publication, the two papers containing nearly the same reading matter. The *Palladium*, started as the *Massachusetts Mercury* in 1793, had had a brilliant career of its own for nearly forty years, under the management of Alexander Young and Thomas Minns. In 1836 the proprietors of the *Centinel* and *Palladium* bought and absorbed—

6. The *Boston Gazette*, the fourth newspaper in Boston bearing that name, started as the *Boston Price Current and Marine Intelligencer* in September, 1795, and known for some years subsequently as *Russell's Gazette*. Four years later, 1840, the owners, oppressed by their

The number of these consolidations given in the table does not represent the actual number typified in existing newspapers, which I assume to be much larger. Many of these absorptions and consolidations have occurred in the past, of which the present proprietors of the surviving journals have no knowledge and made no report; in other cases the failure to report was by accident or by design; and it has frequently happened that the elimination of a rival newspaper has occurred by purchase outright of good-will and appurtenances, the rival disappearing, leaving no sign. Such a suspension is in the nature of an absorption, and no suspensions of this class are represented in the figures given.

The most stable press in the world is that of Great Britain. In proportion to the number of newspapers published in the United Kingdom, there is among them a greater average longevity than the press of any other country can show. The press of the United States stands second to that of Great Britain in stability, and what it lacks in this respect may be said to be due to its prematurity alone. In every state and every city of the Union it has advanced faster than the community itself, overleaping its field, so to speak; and it has suffered the consequences in a remarkable and uninterrupted mortality. In this tendency to anticipate American journalism presents one of its chief points of contrast to that of every other country. It is a tendency largely due, in the first instance, to the total freedom from all government tax and supervision—a freedom such as the press now enjoys nowhere else in the world, save in Great Britain, and has but briefly enjoyed there. Everywhere on the continent of Europe the right to regulate the utterances of the press is claimed to inhere in the government, and is frequently exercised, even to the total suppression of offending journals of character and long standing, and it is impossible, where the conditions of existence are so totally different, to make any effective comparison with the press of the United States, and none has been attempted in this report. The causes of the instability observable in the continental press differ as widely from those in operation in the United States as do the spirit and character of the governments of these nations.

Comparative stability
of British and American
press.

THE HALF-CENTURY PRESS.

To complete the record under this topic I have prepared a list of the existing newspapers in the United States which have been in existence for fifty years or longer. This list includes a number of daily newspapers which have grown out of weekly establishments, and which are therefore entitled to the antiquity belonging to the latter, and is made up from the schedules returned by the publishers themselves. Several journals are included in it about whose title to the date of establishment claimed there may be a reasonable question raised, as they are built upon the foundations of earlier newspapers which expired, or are revivals of newspaper enterprises which were suspended for a longer or shorter period. Even including all such, the list embraces but 370 establishments, and is as enumerated on the following pages. (a)

Half-century newspa-
pers.

repeated acquisitions and responsibilities, transferred the entire property and good-will of these several newspapers to Mr. Hale, and they also became from that time a part of the *Daily Advertiser*.

7. The *Repertory*, first published in Boston in the autumn of 1803, in the senate chamber of the old state-house, and afterward at the Exchange coffee-house, by William W. Clapp, was united with the *Daily Advertiser* at the outset, and the name was for a time a part of the title. Its separate publication was continued weekly under Mr. Hale's direction some time longer.

8. The *Boston Weekly Messenger*, established in 1810, of which Mr. Hale was one of the editors, formed a closer alliance with the *Daily Advertiser* in 1815, and Mr. Hale was soon after announced as the publisher. It was printed "for the country", and contained much of the reading of the *Daily Advertiser* until its separate identity was lost altogether.

The Philadelphia *North American*, which traces its origin to the Pennsylvania *Packet and General Advertiser*, established in 1771, represents the following nine papers, which disappeared in it at the dates given: *American Daily Advertiser*, 1784; *Gazette of the United States*, 1789; *Evening Advertiser*, 1793; *United States Gazette*, 1804; *True American*, 1820; *Commercial Chronicle*, 1820; *The Union*, 1820; *Commercial Herald*, 1840; and *North American*, 1839.

a There is a long-standing controversy as to which is the oldest American newspaper now published in the United States. Munsell claimed in 1869 that this honor belonged to the *New Hampshire Gazette* (now the weekly edition of the Portsmouth *Daily Chronicle*), founded at Portsmouth by Daniel Fowle in August, 1756. This claim was disputed by the Newport *Mercury*, which James Franklin founded upon being driven from Boston, the first number appearing June 12, 1758. The proprietors of the *Mercury* dispute the claim of the *New Hampshire Gazette* to be the oldest paper, on the ground that the *Gazette*, having suspended publication for several months in 1861, it was, when revived, a different and distinct newspaper. But this argument is fatal to the claim of the *Mercury*, since it is a fact year, fearing that the British, who were preparing to land, would destroy his types and press. Its publication was not resumed until January 1, 1780, when Henry Barber became its publisher. On the other hand, the Hartford *Courant*, whose predecessor, the *Connecticut Courant*, was first regularly brought out by Thomas Green November 19, 1764, claims to be the oldest living newspaper in the United States, on the ground that it has been regularly continued without interregnum or change of name from that day to this; a statement which is not true in reference to any existing papers which bear a prior date of establishment. The *Maryland Gazette*, which was first founded in 1745, keeps that date at the head of its columns, and would appear, therefore, to be the oldest existing newspaper. All the evidence, however, tends to the conclusion that the *Gazette* which was established in the year named ceased to exist in 1839. The fact is so stated in Ridgesly's *Annals of Annapolis*, and the corresponding secretary of the Maryland Historical Society, John W. M. Lee, writes that there are no files in the collections of that society later than the date named. The *Maryland Journal*, which commenced August 20, 1773, ceased publication July 1, 1797, with No. 3,429. The *American and Daily Advertiser* commenced with volume 1, No. 1, on May 14, 1799, and has continued to the present date without break as the *Baltimore American and Commercial Advertiser*.

THE LAW OF NEWSPAPER GROWTH.

To the question whether the remarkable growth of the newspaper and periodical press indicated in these tables is natural and healthy and likely to continue indefinitely in a somewhat corresponding ratio I can only make answer yes, and then indicate certain limitations which have suggested themselves in the course of the investigation. The more newspapers there are in a locality the more thrifty, intelligent, and enterprising that locality is found to be. Except in metropolitan districts, however, there is a well-defined limit, having its due relations to population and the character and pursuits of that population, where too many newspapers become an impediment to the prosperity, and therefore to the usefulness of each other. There is a law of supply and demand in the matter of newspaper publication which asserts itself in due progress of time, to the control of the natural tendency to overdo newspaper printing, and it is under the operation of this law that we have the extraordinary record of newspaper suspensions during the census year—a record we have seen to be not peculiar to that year. A well-established and healthy journal lives upon the evidence it is able to give in each issue of the fact of its healthfulness, and the rivals which are constantly springing up must give and maintain equal evidence of such fact to become permanent. When that is given, without taking from the similar condition of the earlier established sheet, the evidence is complete that the field is large enough for both or all. It is, however, a question which in many cases can only be tested by actual experience, and is being constantly tested in large and small towns at the cost of the experimenters, the law of the survival of the fittest prevailing with constantly increasing uniformity in the development of the newspaper press. Thus this investigation has demonstrated the fact that the overwhelming proportion of the newspaper suspensions of the census year were journals of recent establishment, quite frequently journals which had not yet completed a year of existence, and the exceptions to this law occur in cases where a particular newspaper is established for a particular purpose, political or otherwise, and is sustained, not from its earnings, but from the contributions of interested parties. Instances of this kind, I am led to believe, are becoming rarer as the functions of the newspaper and the conditions of financial success are more widely understood.

Is it a healthy growth?

The law of newspaper growth.

The survival of the fittest.

Accepting the rule defined as the true one, it follows that the longer a journal has been established the greater is its chance for holding its own against any and all comers. A theory of this kind cannot be demonstrated by statistics; and yet it may be somewhat fortified by the figures in Table VII, which show that 1,216 of the papers existing in 1880 were established previous to 1850, in which year the total number of periodicals was 2,526. It is a fair inference that almost precisely half of the newspapers and periodicals in existence in 1850 are still alive, but many circumstances may intervene to create exceptions to the rule of a character which it is not necessary to elaborate.

In determining the question whether this growth of newspapers is an abnormal one I know of no better rule to adopt than that laid down by the late Horace Greeley in his interesting testimony before a parliamentary committee of the English commons, appointed in 1851 to inquire into the expediency of the repeal of the stamp duty in Great Britain on newspapers and the duty on advertisements. Mr. Greeley was asked, "At what amount of population of a town in America do they first begin the publication of a week'y newspaper, and also a daily newspaper?" He answered the question as follows:

Horace Greeley on the law of newspaper growth.

With regard to newspapers, the general rule is that each town will have one. In all the free states, if a county has a population of 20,000 it has two newspapers—one of each party. The general average is about one local journal in the agricultural counties for 10,000 inhabitants. A county containing 50,000 has five journals, which are weekly papers; and when a town grows to have as many as 15,000 inhabitants, or thereabout, then it has a daily paper. Sometimes that is the case when it has as few as 10,000. It depends much on the business of the place, but 15,000 may be stated as the average at which a daily paper commences. At 20,000 they have two, and so on. In central towns, like Buffalo, Rochester, Troy, and such towns, they have from three to five daily journals, each of which prints a weekly or semi-weekly journal.

As a general statement of the case Mr. Greeley's diagnosis is nearly as accurate for to-day as it was thirty years ago. "Each town will have one" about as soon as it concentrates sufficient business to keep a respectable job-printing office alive. (a) In the agricultural counties the county-seat is generally the location of two weekly papers, which make it a point to collect the vicinity news of such other outlying towns as are in the county. The location at the county-seat has certain advantages in the way of official and other printing which make it always the first point in a newly developing locality for the establishing of newspapers unless there are commercial reasons which tend to carry population and business away from the county-seat, such as the location on a railroad or navigable stream. The number of weekly journals rarely gets above three in a town without the appearance of a daily there, and it is the competition of the weekly papers which frequently supplies a town with two dailies before it has amassed sufficient nutriment for the sustenance of one.

As to weeklies.

As to dailies.

^a There are numerous notable exceptions to this statement, as may be illustrated by the returns from Massachusetts. The town of Chicopee, in that state, with a population of 11,286, has no newspaper. Malden, with a population of 12,017, has but one newspaper, a weekly. On the other hand, Berlin, with a population of 977, Bolton, with a population of 903, and Shrewsbury, with a population of 1,500, each had a weekly newspaper, which was printed in another town, however, in the case of Berlin and Bolton. Ayer, with a population of 1,881, and Yarmouth, with a population of 2,173, each had two newspapers. Andover, Blackstone, Montague, Millbury, West Springfield, and North Bridgewater, with over 4,000 population each, had no weekly newspapers. Quincy, Weymouth, and Milford, with over 9,000 population each, had but one weekly newspaper each.

Geographical and commercial configurations have much to do with these things. There are many towns in the United States of from 15,000 to 20,000 inhabitants which are still without a daily newspaper, and it is to be

Geographical and commercial limitations.

observed that they are almost invariably located in the eastern or middle states. Striking illustrations are Pittsfield, Massachusetts, with 13,364 population; Gloucester, Massachusetts, with 19,329; Holyoke, Massachusetts, with 21,915; Hoboken, New Jersey, with 30,999; Watervliet, New York, with 22,220; Norwalk, Connecticut, with 13,956; Chelsea, Massachusetts, with 21,782; Pawtucket, Rhode Island, with 19,030, and Yonkers, New York, with 18,892. These large towns without daily

Large towns without dailies.

newspapers generally belong in one or the other of two categories: they are given up to manufacturing chiefly, or they are places of suburban residence for the population of large contiguous cities. Very frequently the manufacturing towns are immediately abutting large cities, from which they obtain their daily papers quite as early as they are distributed in the city of publication, and of much better quality than home enterprise can supply. This is the case in all the towns of suburban

Different conditions in the western states.

residence. This class of towns is rare in the western states, the towns there being more widely separated in distance as well as in interests, and not accessible to early editions of the better newspapers of the large cities.

In the interval since Mr. Greeley made his estimate the size of the town in which a daily will make its appearance on the average has been very considerably decreased. This fact is illustrated in detail by the following table, prepared for that purpose. It is a table which shows every city and town, with its population, in which one or more daily papers were printed in the census year:

A LIST OF THE COUNTIES AND TOWNS IN THE SEVERAL STATES AND TERRITORIES IN WHICH DAILY NEWSPAPERS WERE PUBLISHED, WITH THE POPULATION AND NUMBER OF PAPERS IN EACH.

NOTE.—In contrast with the facts presented in this table, the following prediction, from James Grant's *History of the English Newspaper Press*, published in 1872, is suggestive: "I look forward with complete confidence to the publication, within the next ten years, throughout the British kingdom of daily papers in every town containing a population of 20,000." Mr. Grant's prediction, it is proper to add, is in no danger of verification, notwithstanding the fact that since he wrote the weekly provincial press of England has continued to develop rapidly into twice-a-week papers, and from twice-a-week papers into dailies. At the time Mr. Grant wrote there were still very many large provincial English towns without dailies. Portsmouth, for instance, with a population of 120,000, was served by one semi-weekly and one weekly paper. It had in 1880 one daily (evening), established in 1877, and two semi-weekly papers. The city of Dover, Kent county, England, population 30,000, had no daily at that time. It possessed but five weeklies in 1872, and in 1880, still without a daily, it had but four weeklies. Hastings, Sussex county, with a population of 30,000, supports no less than nine weeklies (most of them published either on Friday or Saturday) and no daily. Southampton, population 58,000, had in 1880 nine weeklies, one semi-weekly, and no daily. (See *post*, list of thirty-six English towns, with populations exceeding 20,000, in which no daily is published.) In somewhat singular contrast to Mr. Grant's prediction is his statement elsewhere, in referring to the establishment of the *Brighton Daily News* in 1868, that "it was a bold experiment to seek to establish a daily paper in a town whose population at the time did not much exceed 70,000, and for the first two or three years it appeared doubtful whether it would succeed".

THE LOCATION OF THE DAILY NEWSPAPER PRESS.

It appears from the preceding table that the 971 daily newspapers of the census year were published in 389 towns or cities, which makes an average of $2\frac{1}{2}$ to each of these towns or cities. The strange anomaly is here discovered of towns of less than 4,000 inhabitants where two and sometimes three daily papers were published. The smallest town in the United States in which a daily paper was published was Elko, Nevada, with a population of 752. The smallest town in which two daily papers were published was Tombstone, Arizona, with a population of 973. The enterprising publishers of the latter town are doubtless confident that it will grow up to their stature. In California the town of Eureka, population 2,639, had three daily papers, and the town of Red Bluff, population 2,106, two daily papers. Galena, Kansas, had one daily for a population of 1,463; Greenville, Michigan, two dailies for a population of 3,144; Olean, New York, one daily

Average number of
dailies in cities.

for a population of 3,036; Winnemucca, Nevada, one daily for a population of 763; and Milton, Pennsylvania, one daily for a population of 2,102. These are the most striking instances of daily publications in small towns. The table may be taken as establishing another conclusion, reached elsewhere in this report: that the tendency is not to the increase in the number of daily newspapers as the size of the city increases, but rather to the increase in the circulation of those already existing. Thus, Kansas City, with 55,785 inhabitants, had six daily papers in the census year, which is one more than Louisville, Kentucky, with 123,758, sustained. It is not necessary to add that in every instance where a city is overstocked with daily newspapers the fact is at once evident upon an inspection of the issues that come from their presses and a comparison of their character, contents, and appearance with those of the newspapers printed in towns of equal size, where the number is confined to one or two. These conditions of development in the newspaper press are the incidents of our civilization, and disappear as this civilization takes on its maturer forms, the journals of every locality being more or less an accurate type of the character, condition, and pursuits of the people of that locality.

For the eastern manufacturing and suburban towns without dailies, to which allusion has been made, the weekly press performs very much the same service as that rendered by the London local press, so called. The latter, however, is a distinctive feature of English journalism, such as can only come in the United States with large segregations of population about a common center. This London local press has grown up The London local press. entirely within the past twenty-five years. In the first issue of the *London Press Directory* (1846) there was but one of these journals recorded, the *South London Press*. There are now no less than 104 local papers published in the several outlying districts of London, including several dailies and semi-weeklies, most of them conducted in a creditable manner, and some of them reaching a high point of excellence as well as great financial prosperity. (a) The success of these journals may be ascribed to the necessity, long felt by the residents of the metropolitan boroughs, for some sort of representation in the press. The vestries dispose annually of revenues greater than those of many German principalities, and the annual budget of the metropolitan board of works has for many years exceeded that of at least one European kingdom; yet the daily and weekly press of London, occupied with the affairs of imperial policy, abstained from reporting the proceedings of the vestries, and chronicled the doings of the board of works in small type and obscure paragraphs. (b) The fact that these local weekly sheets can thrive under the very nose of the mammoth newspapers of the capital and do a good work in every considerable London borough is given as a reason for believing that there are certain functions of the local press which cannot be absorbed by the metropolitan dailies, and that the prosperity of one class of journals will continue to increase in the same ratio, though in the smaller sphere, with that of the other. For one purpose the Boston dailies serve the people of the New England towns with better success than dailies of their own can ever do; but they can never supersede the local press, whose mission it is to record and preserve the chronicles of the parish.

THE LOCALIZATION OF THE AMERICAN PRESS.

It is the remarkable localization of the American newspaper press which distinguishes it particularly from that of any other country and constitutes what may be regarded as one of its best characteristics. The press of the United States is not concentrated, like that of other countries with a well-developed journalism, but is localized; and its tendency has been, and continues to be, constantly toward minuter localization. Every hamlet has its mouthpiece through the printing press, and every city is independent of every other city for its daily news supply. Here is the first condition met of a healthy and progressive national journalism; and it is the condition which will always keep the American press what it now is: the freest, the most self-reliant, the most loyal to home and vicinity interest, in the world.

Tables XII and XIV of this report afford striking evidence of this localization. The latter table shows that of the 2,605 counties into which the forty-six states and territories are subdivided newspapers are published in 2,073 of them. In sixteen of the thirty-eight states there was at least one newspaper published in every county within its limits. An analysis of the table shows that these sixteen states are the only ones in which it can be claimed that civilization has progressed to every county within their borders. They include all the states ordinarily classified as belonging to the New England group, and all the states which, under the like classification, are grouped as middle states. Missouri presents the most noteworthy instance of a large state of comparatively recent colonization in which a newspaper was published in every county—an instance rendered the more noteworthy from the fact that there are 114 counties within its limits, a number exceeded by only three states in the Union. The sixteen states which made the same showing were Connecticut, Delaware, Illinois, Indiana, Iowa, Maine, Maryland, Massachusetts, Missouri, New Hampshire, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, and Vermont. It is plain that these are the only states regarding which it can be claimed that settlement in all parts has reached mature limits.

By a comparison of Tables XII and XIV it will be seen that a striking similarity of figures is presented by both. The sixteen states in which every county has a newspaper of its own are those in which the average area for

a The Clerkenwell *Times* is the most striking illustration of this statement.

b Francis Hitchman, in *London Quarterly Review*, October, 1880.

each publication in square miles is the smallest, and they are also the states in which the aggregate number of inhabitants to the aggregate circulation per issue is the smallest. It will also be seen from Table XIV that in a majority of the counties of the northern states in which one newspaper was published there were two or more. It also shows that there were in the census year 2,459 towns and villages in the country in which one newspaper was published, 1,026 towns and villages in which two newspapers were published, 375 towns and villages with three newspapers only, 209 with four newspapers, and 329 in which five or more newspapers and periodicals were published, showing a total number of 4,398 cities, towns, and villages in which the 11,314 publications of all kinds were printed. These are statistics not duplicated nor approached anywhere in the world, and they bring out in the most striking light what may be called the distinguishing peculiarity of the American press. Literally, as Carlyle says, "a preaching friar has erected his pulpit in every village." The majority of these journals are allied to one or the other of the existing political parties, and to that extent they are *sui generis*; but each has one particular interest closer than its politics. Each one is the champion and representative of its particular locality, and is concerned, first of all, in whatever relates to the honor and material advancement of that locality. The closer home to the daily routine of the people the newspaper comes, the greater is the power it exerts. It is the local newspaper in this sense that distinguishes American journalism above that of all other countries, and is, on the whole, the most admirable product of the printing press in this country.

THE CIRCULATION OF NEWSPAPERS.

Tables II and III contain the important statistics relating to the general circulation of newspapers and periodicals in the United States during the census year. The details respecting the circulation of particular classes of periodicals, as the religious press, the agricultural press, etc., are given in the body of this report without tabular statement.

In regard to the circulation of newspapers and periodicals, some difficulty was experienced in a number of

^a In verification of this statement, and for the general purpose of supplying a basis of comparison in number and circulation between Haven, from his *Newspaper and Book Directory of the World* (1881), is given:

of increase in population in the decade was 30.08 per cent. The difference between these percentages may be taken as indicating the increase in the newspaper-reading habits of the American people. It is, however, worthy of note that the average circulation of all the periodicals published in 1880 is not as large as that indicated in other United States censuses. The average circulation of the 2,526 publications reported in 1850 was 2,036; that of the 4,051 publications reported in 1860, 3,373; that of the 5,871 publications reported in 1870, 3,550; while the average circulation of the 11,314 publications reported in 1880 is but 2,809. A large part of this difference, it is believed, is due to the much more rigid scrutiny to which the statistics of circulation were subjected in 1880.

The largest aggregate daily circulation of any state occurs in New York, where 996,561 copies are printed daily, which is 27.94 per cent. of the entire daily circulation of the country, while only 11.84 per cent. of the entire number of daily papers are published in that state. The statistics of New York thus forcibly illustrate the fact that the aggregate circulation of newspapers is not dependent in any degree upon the number of those newspapers. The fact may be shown in the same way with respect to weekly newspapers and periodicals of all classes of issue.

Circulation of New York daily newspapers.

Pennsylvania shows the second largest aggregate daily circulation, Massachusetts the third, Illinois the fourth, Ohio the fifth, and California the sixth. Excluding the territories, Florida shows the smallest aggregate daily circulation, with West Virginia second, Vermont and Mississippi third, and Arkansas fourth.

Daily newspaper circulation in other states.

New York also shows the largest aggregate circulation of weekly newspapers, the figures being double those of Pennsylvania, which comes next in order. Illinois stands third, Ohio fourth, Massachusetts fifth, and Missouri sixth. The states in which the aggregate weekly circulation is the smallest are, in their order (excluding the territories again): Nevada, Delaware, Florida, Rhode Island, Oregon, South Carolina, and Colorado.

Circulation of weekly newspapers by states.

New York shows the largest aggregate circulation of monthly periodicals, Pennsylvania being second, Maine third, Ohio fourth, and Massachusetts fifth. Maine is brought into this prominence by the great success that attends the publication of several magazines devoted to family reading in Portland and Augusta.

Circulation of monthly periodicals.

The figures localizing the average circulation of the several classes of newspapers have a certain value, but they may easily mislead. In a town where two newspapers are published, one with a circulation of 10,000 and the other of 2,000, it is correct to say that the average circulation of the papers published in that town is 6,000; but in so saying we are not giving a true conception of the division. In order to avoid the misconceptions which may thus arise a table (No. III) has been prepared, which further classifies the press of the United States by the volume of circulation. Nine groups were made, as follows:

Table III.

- I. Periodicals having a circulation of 50,000 or over.
- II. Periodicals having a circulation of 25,000 and under 50,000.
- III. Periodicals having a circulation of 15,000 and under 25,000.
- IV. Periodicals having a circulation of 10,000 and under 15,000.
- V. Periodicals having a circulation of 5,000 and under 10,000.
- VI. Periodicals having a circulation of 3,000 and under 5,000.
- VII. Periodicals having a circulation of 1,000 and under 3,000.
- VIII. Periodicals having a circulation of 500 and under 1,000.
- IX. Periodicals having a circulation of less than 500.

Group VIII was found to contain the largest number of weeklies, and Group VII the largest number of daily newspapers. The fact indicated in Table II, that the daily newspapers of the United States will average a larger circulation than the weekly press, was thus verified. In the last class, that of journals with a circulation of less than 500, are included 86 dailies, 1,216 weeklies, and 188 publications of all other periods of issue. Missouri boasted the largest number (14) of these dailies of meager issue, California the second largest number (12), and Ohio the third largest number (7). These were generally dailies which had been established in the census year or immediately previous to it, and were incidental to the crude civilization of newly-founded towns. There were but 268 daily journals with a circulation of 3,000 and over, and the largest group of these (112) was under 5,000 in average daily issue. A circulation which can be regularly maintained between these figures is rightly regarded as a healthy and profitable one, where undue competition is not the reason for failure to reach higher figures and expenses can be kept down to a corresponding ratio. The greater portion of the daily journals whose circulation is placed at 1,000 and under 3,000 are profitable pieces of property on the more limited scale. Receipts from advertising bear an intimate relation to circulation, and the journals which run from 10,000 to 15,000, and from these figures upward, are the ones which enjoy large returns from the capital and labor invested. Their number is limited, there being but 84 in the whole country. Of these, 34 have a daily circulation of 10,000 and less than 15,000, 25 have a circulation of 15,000 and less than 25,000, 18 have a circulation of 25,000 and less than 50,000, and 7 have a circulation of 50,000 and over, 3 of the latter number exceeding 100,000 in their daily issue.

Division of newspapers by volume of circulation.

A profitable average daily circulation.

THE RELATION OF CIRCULATION TO POPULATION.

The relation of the circulation of daily newspapers to population offers an interesting and perplexing field of inquiry. The daily journal is of course read regularly to any marked extent only in sections of country that are thickly settled or can be promptly reached by rail from the cities. The entire aggregate circulation of the daily papers of the mammoth state of Texas (30,297) is less than that of the daily journals of little Rhode Island (41,402). No conclusions as to the relative intelligence of a people or their alertness in public affairs can justly be based upon such statistics; nor is it possible to make comparisons between cities with a view to like deductions.

Circulation of daily newspapers as related to population.

This is the conclusion to be drawn from the following table, which gives the number and circulation of the 232 daily journals published in twenty-six of the principal cities of the United States, with the population of each city and the number of inhabitants to each copy issued daily:

Daily circulation in twenty-six cities.

Number of daily papers published in the city of—	Total number.	Morning.	Evening.	Aggregate circulation per issue.	Population of city.	No. of inhabitants to each copy issued.	Rank.
New York, New York	29	20	9	765,843	1,206,299	1.58	2
Philadelphia, Pennsylvania	24	13	11	375,274	847,170	2.26	9
Brooklyn, New York	4		4	48,537	566,663	11.67	26
Chicago, Illinois	18	10	8	220,577	503,185	2.28	10
Boston, Massachusetts	11	6	5	221,315	362,839	1.64	4
Saint Louis, Missouri	9	8	1	99,364	350,518	3.52	16

The number of papers published in these twenty-six cities is considerably larger than the total number (72) with a circulation of 5,000 and less than 10,000, while included among them are a large number which belong in the class with circulations of less than 3,000, and even in the class below.

There are not, however, a dozen cities in the United States, not included in this twenty-six, which sustain daily journals with circulations regularly kept between 5,000 and 10,000. In these cities such a circulation is obtained by exceptional facilities for supplying a thickly-settled surrounding country with daily papers. The average number of inhabitants to each daily paper printed in these twenty-six cities, taking them together, was 2.48, and, accepting this average for any city of 50,000 inhabitants, the aggregate circulation of all its daily papers would be but 20,161. The fact that seventeen of the twenty-six cities in the table show a larger ratio of daily circulation to population is simply evidence that they have superior facilities over the other nine for outside circulation, the ratio being increased correspondingly. New Orleans, which is an isolated city in this respect, averages one copy to every 5.76, and Washington, District of Columbia, which is situated in like manner, averages one copy to every 4.27, which is an extraordinary average for a city thus situated and with so large a colored population. Milwaukee, Wisconsin, with an average of one copy to every 4.76, is the best illustration on this point afforded by a northern city. On the other hand, Brooklyn, with an average of 11.67 to every daily paper printed there, and standing lowest in the list, doubtless has as many newspaper readers in proportion to population as any city in the Union, the low average being explained by the fact that the newspapers of New York city are circulated there simultaneously with those of its own manufacture and share with the latter the favor of the reading public. Newark, New Jersey, which ranks twenty-third, and Jersey City, which ranks twenty-fifth, are accounted for in the same way. It is to be noticed that the latter city, with a population of

Analysis of the table.

120,722, has a smaller aggregate circulation of daily newspapers published in its midst than the aggregate we have estimated as a fair average circulation for a city of 50,000. The city of Springfield, Massachusetts, has been introduced into this table for the purpose of illustrating the relations of newspaper circulation to the geographical and commercial situation of a town. With a population of 33,340, three Springfield newspapers circulated daily 18,464 copies (nearly 75 per cent. of which circulation was in the towns and villages within prompt railroad reach, the *Republican* penetrating every morning into four states), which was over a hundred more than Newark, New Jersey, circulated with its population of 136,508. On the other hand, the daily journals printed in Newark, New Jersey, were largely confined in circulation to that city, being met on the east by the more pretentious papers of New York and on the west by those of Philadelphia, while thousands of copies of the newspapers of these two cities were sold every day in Newark.

Table XII has shown us that the aggregate circulation per issue of the press of the United States is equivalent to one copy regularly sent to every 1.58 inhabitants returned by the Tenth Census. It may be assumed that every paper published and circulated is read by an average of at least two persons, the majority of those issued penetrating into families numbering from three to four persons. In other words, newspapers enough are now printed to supply every person of a reading age with a journal to read as often at least as once a week. Of course

Newspaper diffusion in the United States.

we have many adults who never read a newspaper, but it is not, as elsewhere, for the lack of them; and as the years pass the diffusion of the American newspaper is growing more penetrating and minute. The newspaper diffusion of the United States, due to its minute localization, as already considered, reaches a degree unattained in any other country, and warrants the claim in its behalf of an exceptional influence upon the opinions of the people of the whole country. The average number of inhabitants to circulation in the several states, as shown in Table XII, is subject to certain qualifications, which reduce the disparities exhibited in that table very largely. There are certain cities which are known as "newspaper centers", from which are issued every day, week, and month thousands of newspapers and periodicals which are circulated outside the states in which the cities of publication are located. Table XV is an exhibit of the press statistics of the ten principal cities of this character, viz, New York, Philadelphia, Boston, Chicago, Cincinnati, Baltimore, Saint Louis, San Francisco, New Orleans, and Louisville. It will be observed that the ten states in which these cities are located reach in Table XII the smallest average number of inhabitants to the aggregate circulation, excepting only Maine, in which case the small average is accounted for by the publication of a number of family story papers, which circulate all over the Union. On the other hand, the states showing the largest average are those situated most remotely from these and the minor centers of periodical publication, such as Alabama, Mississippi, North and South Carolina, and the territories. (a) While the ten or eleven states named do not wholly deserve the high rank, in respect to the newspaper reading propensities of their inhabitants, assigned them in these tables, it is worthy of attention that the other states which take the lowest rank in the same tables are the same states in which the educational statistics of the Tenth Census indicate the same relative rank of popular intelligence in the population. The limitations suggested upon the natural conclusions to be drawn from these tables do not in any sense destroy this relative rank in the matter of newspaper and periodical diffusion among their inhabitants, but simply guard against a too violent contrast, by indicating that the disparities, while undoubtedly existing, may be somewhat softened by a due consideration of the collateral circumstances. It is undoubtedly true of the United States, in a larger degree than of any other country, that the comparative degree of newspaper circulation among the people is regulated and limited by the facilities which attend the extension of that circulation.

CAPITAL, GROSS PRODUCTS, AND RAW MATERIALS.

Table IV shows the total amount paid in wages and the total gross products of newspapers and periodicals published in the United States during the census year, with the percentage of wages paid by daily, weekly, and other periodicals, the percentage of receipts from advertisements and from subscriptions, the number of hands employed in printing and publishing periodicals, and the number of persons employed in editorial work. This table contains, therefore, the chief statistics gathered respecting the financial or material condition of the American press.

No effort was made to gather statistics as to the amount of capital invested in the newspaper or periodical business, all queries of this character being omitted from the press schedules, in accordance with the opinion expressed by the Superintendent in the Ninth Census that the inquiry is one which ought never to be embraced in the schedules of the census, and that "the census returns of capital invested in manufactures are entirely untrustworthy and delusive". It was felt that this conclusion would apply to the printing business, as connected with the publication of newspapers and periodicals, with greater force than to almost any other industry, for the reason that the product of the newspaper printing press is altogether out of proportion to the usual calculations by which relations between wages paid and materials used to that product are reached. The value of a newspaper or a periodical is largely determined by the character of the brain labor

^a It is noteworthy that this difference between northern and southern states has existed from the very beginning of newspaper publication in this country. Noah Webster in 1785 ascertained that the circulation of newspapers in the single New England state of Connecticut was equal to that of the whole American territory south of Pennsylvania.—*Webster's Essays*, pp. 338-360.

placed therein. More than 50 per cent. of the gross product, on the other hand, is found to be derived from a source of revenue the intrinsic value of which depends upon other conditions altogether than the capital invested, the labor employed, or the material used. This is the advertisement, the rates received by the several newspaper establishments being governed by considerations which throw these elements of cost entirely out of the calculation. The cost of putting into type an advertisement of a certain length and character does not vary largely in any of the newspaper establishments where payment for composition is made by the piece; but certain newspapers will receive in payment for the same advertisement double, treble, or quadruple the price received by other newspapers which have been to the same outlay in preparing it for publication. The cost of the white paper upon which an advertisement is printed will not vary largely in a multitude of cases, and never varies in anything like the ratio of the money received for its publication. Neither is there any corresponding ratio of variation in the cost of the original plant, the value of the gross products of the newspaper press clearly bearing no definite and determinable relation to the amount of capital invested in the establishment. The Superintendent declared in the Ninth Census that "no man in business knows what he is worth; far less can he say what portion of his estate is to be treated as capital".

Peculiar relation of capital to product.

CAPITAL INVESTED IN NEWSPAPERS.

I believe this statement applies more accurately to the newspaper press than to any other branch of industry in the United States, and for the reasons given. There are a number of establishments in the United States to-day the annual income of which is many thousands of dollars in excess of all the capital which has been actually invested in the shape of plant and its repair since the establishments were first founded, often without any capital at all beyond the bare cost of that plant. The plant itself of a newspaper, it will be understood from what has been said on the subject elsewhere, is the smallest part of the value of a successful journal, the real value being dependent upon what is somewhat indefinitely described as the "good-will", the value of which, in turn, depends largely upon location. Good-will is something which may properly be considered as an element of capital, and always is the chief element in newspaper transfers; but it is an element which cannot be estimated in dollars and cents, either by the Census Office or by the parties making return to the Census Office on its schedules. The gross receipts of a newspaper depend altogether on this good-will, and not at all upon the size or character of the plant or the paper itself; not at all, in other words, upon the amount of capital actually invested or employed in the carrying on of the establishment. The impossibility of framing a definition of manufacturing capital which shall fit a business governed entirely by such circumstances does not need argument.

"Good-will" as an element of capital.

I will not undertake to say, therefore, that the \$89,009,074 of gross product returned for the newspaper and periodical press bears any tangible relation to the amount of capital which is invested in this business in the United States. On the other hand, it can be said that there is no business which shows such large gross receipts, with so small an actual investment of capital behind them. This interesting fact may be better understood by a reference to the discussion of the conditions determining the value of newspaper property in the subsequent pages of this report.

Large product from small capital invested.

Another fact of importance is that, taking the gross product of newspapers as given for 1880 and comparing it with figures of previous censuses, the increase has been enormous; and it may well be doubted if any other branch of census inquiry will reveal either so large a ratio of increase in the number of establishments or so large and corresponding an increase in the gross earnings.

Great increase in gross product.

On pages 51 and 52 of this report the statistics of the previous federal censuses, relating to the capital invested, amount of materials used, wages paid, and the value of the gross product of the newspaper and periodical press of the United States, have been summarized. The difficulties in the way of using those figures for comparison with the statistics now supplied are there broadly hinted at. If we accept them as a basis, we find that between 1870 and 1880 the number of hands employed in the newspaper offices of the whole country has increased from 13,130 to 65,015; the amount of wages paid has increased from \$8,168,515 to \$28,559,336 38; the value of materials used in manufacture has increased from \$8,709,632 to \$15,385,303 84, excluding from the latter figures all account of tools, machinery, and everything, in short, but the bare cost of ink and paper; and that the value of the gross product has increased from \$25,393,029 to \$89,009,074. Every deduction to be drawn from these figures sustains the conclusions of this report. They show that while the value of materials used has not doubled, the value of the gross product has increased nearly 3.60 times.

The amount paid in wages has increased in nearly the same ratio as the increase in the value of the gross product; and if an attempt were to be made to estimate the amount of capital now invested in newspaper enterprises, it would bring us inevitably to the conclusion that it would show an increase corresponding with the increase in wages paid and in gross product. The Ninth Census reported the capital employed in newspaper enterprise at \$14,947,887. On the basis of calculation indicated the capital now so employed would approximate \$53,000,000. On the basis of the intrinsic valuation, as determined by the net earnings, these figures would be indefinitely increased. Mr. Hudson states that the amount of capital represented in the New York daily press of 1872, on the basis of valuation, has been estimated at

Comparison with Ninth Census.

\$8,000,000; and he adds, what is obvious, that they do not represent more than one-sixteenth of that sum in original investment. The money value of the great majority of the newspaper establishments of to-day is a self-created value, and therein it differs from the capitalization represented in the general statistics of the Tenth Census.

THE COST OF INK AND PAPER.

The only raw materials which can properly be said to enter into the composition of the newspaper or periodical are the ink and the paper used in printing it. Of these two materials the former is an insignificant element of the cost. Ink is purchased by the publisher at rates which vary from 6 to 10 cents per pound, according to the quantity, quality, and location where used. Experience shows that a pound of ink, as it is ordinarily used, is sufficient to work from 600 to 700 impressions of an ordinary sized newspaper. So that, knowing the total number of the newspaper impressions of the census year to be 2,067,848,209, it is easy to calculate that the total value of the ink used in newspaper printing was in the neighborhood of \$253,700, or only about three one-thousandths of the total gross product reported.

The remaining raw material (paper) is a much more important element of cost, and pains were taken to secure full returns of the amount used in the census year. To make the results as accurate as possible publishers were asked to return the figures not only in reams, but in pounds, and by comparing the figures thus given with the circulation reported the Census Office had a check upon both classes of statistics. Wherever the returns under the heads of paper used and copies printed failed to correspond pains were taken to discover which figure was right, and in this way the aggregate circulation reported by the several publishers was considerably reduced in the end, and is given with confidence that it is very close to the actual fact. The total number of copies of newspapers and periodicals printed in the census year is given as 2,067,848,209 and the total number of reams of paper used as 4,308,012, which is 2,067,845,760 sheets.

The weight of the paper used in printing newspapers and periodicals in the United States varies according to the size and the character of the periodical. De Vinne gives the following table of the regular sizes of American papers prevalent in New York:

	Inches.		Inches.
Medium	10 by 24	Double medium	24 by 38
Royal, 20 by 24, or	20 by 25	Double royal	26 by 40
Super-royal	22 by 28	Double super-royal	28 by 42
Imperial	22 by 32	Double super-royal	29 by 43
Medium and half medium	24 by 30	Broad twelves	23 by 41
Small double medium	24 by 36	Double imperial	32 by 46

Of these sizes the most prevalent in use were found to be the 24 by 36, which is estimated to weigh 30 pounds to one ream of 480 sheets; 28 by 42, which was estimated to weigh 40 pounds to the ream; and 30 by 46, which was estimated to weigh 45 pounds to the ream.

These estimates were reached by careful comparison of the figures returned by the several publishers and by inquiries among the paper-makers. The other sized papers in use were estimated in like manner, pains being taken in all cases to conform the figures finally accepted as nearly as possible to the returns made by the publishers themselves. The result is shown in Table VI. The average number of pounds of paper used by the daily newspapers of the country was 338.47, and by weekly newspapers and all other periodicals 281.86. The latter average is brought to its high figure by the fact that it includes the paper used by the monthly magazines of large circulation, as well as by the story papers and miscellaneous weekly publications of large circulation. The aggregate pounds of paper used per issue by the daily press was 291,764.95, being 7,430.18 reams, the equivalent to an issue of 3,566,486 issues per day from this press. The average weight per ream of the paper used in the daily press was therefore 39.27 pounds per ream. The newspapers and periodicals of every other character and description than diurnal used an aggregate of 2,624,354.92 pounds of paper, representing 58,797 reams, the average weight of which was 44.63 pounds per ream. The average weight of the paper ordinarily used in local weekly papers will not exceed 30 pounds to the ream.

By these averages it is possible to approximate very closely to the actual cost of the paper used in newspaper and periodical printing during the census year. The price of paper is very fluctuating, and the great difference in its quality makes it impossible to apply a certain average price to the value of the paper used by any particular class of newspapers; but I am told by paper-makers that if the general average cost of all the paper used for these purposes in the census year is placed at 8 cents per pound I shall be within the reasonable trade limits. The total pounds of paper used were 189,145,048, and their value on this basis was \$15,131,603 84.

We have thus reached an approximation of the cost of all the raw material used in the manufacture of the American newspaper and periodical. The value of the paper used is 17 per cent. of the total gross product of the newspaper offices. Adding thereto the cost of printing ink, the percentage of the raw material to the gross product is increased to 17.29 per cent., the total being \$15,385,303 84. Perhaps this percentage is larger than it ought to be, to be properly classed in the first group above mentioned, but it is not large enough to warrant its classification in either of the other

Percentage of cost of materials to gross product.

groups enumerated. By the Ninth Census the value of materials represented in \$100 of product in class one was \$10 07; in the manufacture of newspapers, by the Tenth Census, it is \$17 29. In the second class, by the Ninth Census, the value of materials represented in \$100 of gross product was \$43 86; in the third class, \$34 28; in the fourth class, \$56 62; and in the fifth class, \$84 10. It follows that the cost of the raw materials used in newspaper manufacturing is less than that in any other class of manufacturing, and only \$6 41 more than the cost of these materials in the mining and fishing industries. It is obvious, under these circumstances, that a certain class of newspapers make enormous profits upon the capital invested and the expenses incurred. To succeed in newspaper publication is to earn large dividends on small outlay. On the other hand, the failures are as costly in capital, care, and labor squandered as the successes are lucrative.

Before advancing to the discussion of other phases of this inquiry, it should be added that the relations between the manufacture of paper and the publication of newspapers are extremely intimate, the two industries being mutually dependent to a degree which is perhaps not sufficiently brought out by the figures above presented. Upon the price of paper depends the multiplication of newspapers in this country as in no other country of the world, for here, as nowhere else, it is not so much a question as to whether readers can be found as whether they can be supplied at a cost for raw material which permits of profitable publication. The years that have been marked by high prices of printing paper are those which witness the least advance in the number of newspapers. It was not until within the census decade ending with 1880 that the capacity of the paper-mills of the United States began to bear its proper economic relations to the demand, and in consequence there were frequent marked fluctuations in price, which bore most heavily upon the publishers, discouraged new newspaper enterprises, and were accompanied by a long death-roll of suspensions. The period of the civil war was that during which the press suffered most severely from the short production and the high price of printing paper, but there was constant recurrence of such suffering at earlier periods.

The paper trade and the press.

In 1810 the number of paper-mills in the United States was estimated at 185, and they produced annually 50,000 reams of news paper, valued at \$3 per ream; 70,000 reams of book paper, valued at \$3 50; 111,000 reams of writing paper, at \$3; and 100,000 reams of wrapping paper, at 85 cents. In 1828 the newspapers consumed 104,400 reams, costing \$500,000, and the total value of all the paper made was nearly \$7,000,000. In 1850 the annual product of paper was valued at \$17,000,000. In Munsell's *Chronology of Paper and Paper Making* is the following entry for the year 1854:

There were 750 paper-mills in the United States in active operation, having 3,000 engines, and producing annually about 250,000,000 pounds of paper, averaging about 10 cents a pound. This required 405,000,000 pounds of rags, costing 4 cents a pound, for which our seamen had to scour every quarter of the globe. The cost of labor was estimated at 1½ cents a pound; the cost of labor and stock united would be nearly \$20,000,000. The total cost of manufacturing \$27,000,000 worth of paper was supposed to be \$23,625,000. The demand, however, still exceeded the supply, so that the price was advanced 2½ cents a pound.

Since the date of this entry the increase in production has come about not so much by reason of a multiplication of the mills as by the improvement of their processes and the use of new and cheaper raw materials. The census of 1870 reported 669 paper-making establishments, with products valued at \$48,676,985. The following table of the number of paper-mills in operation in the census year shows that the United States stands at the head of the paper-making countries:

Paper-mills of the world.

Germany.....	545	Portugal.....	16
Austria-Hungary	160	Holland.....	16
Belgium.....	29	Roumania.....	1
United States.....	960	Greece.....	1
Denmark.....	18	Switzerland.....	15
France.....	539	Russia.....	160
Great Britain.....	650	Sweden and Norway.....	25
Australia.....	4	Spain.....	63
Canada.....	20	Japan.....	6
Italy.....	206	Cuba.....	1

The United States of America is not only the greatest paper-producing country in the world, but in bulk and per capita it is the greatest paper-consuming country. A report upon the capacity of the paper-mills of this country, prepared for and submitted to the fourth annual meeting of the American Paper Makers' Association, in Saratoga, in July, 1881, by Howard Lockwood, the editor of the *Paper Trade Journal*, of New York, shows an aggregate daily capacity of upward of 5,000,000 pounds of paper of all kinds and descriptions, more than six times the capacity reported by Munsell in 1854. During the past two years there has been an increase in the capacity of American paper-mills of about 1,000,000 pounds. In this period the increase in writing paper was about 33½ per cent., and the increase in book and news paper 25 per cent., these figures representing the capacities and not the actual output of the mills. Two years ago 10 per cent. of the mills were reported idle, and many of them were running on short time. In the year past only 4 per cent. of the mills were idle, and it is fair to presume that the actual production of all the mills during the census year was largely in excess of the increase reported in capacity. It is worthy of attention that a still larger increase in the producing capacity of the paper-mills of the United States is observable as this report goes to press. New mills are being built and projected, old mills

remodeled and enlarged and new materials introduced, while all materials are becoming cheaper, machinery is being simplified and perfected, and everything points to a continuous increase in product.

Mr. Lockwood's estimate of the capacity of the American mills in the manufacture of book and news paper combined, allowing 300 working days to the year, would result, under full pressure, in a product of 417,015,000

Comparative quantity
of paper consumed by
the periodical press.

pounds per annum. Deducting from this aggregate the 189,145,048 pounds of paper found by the census to be consumed by the newspaper and periodical press, there were left 227,869,952 pounds to be consumed in the manufacture of books and pamphlets and in the innumerable varieties of miscellaneous printing which is constantly emanating from thousands of job-printing offices all over the country. The newspapers and periodicals actually consumed, therefore, 45.36 per cent. of all the book and news paper manufactured, which comprised more than one-quarter of the total paper manufacture of the country, including writing, blotting, wrapping, board, card, hanging, and all the varieties of paper.

The remarkable reduction in the cost of printing paper has been spoken of elsewhere as one of the chief causes of the rapid growth of the newspaper and periodical press of the United States during the census year and the census decade. An annual circulation like that reported in 1880 would have been impossible ten years ago, because there were not in the country mills enough to produce the paper now annually consumed. Neither is there any likelihood that the price of paper will ever be higher to any repressive degree than that which now prevails. There are manufacturers who maintain that the country will yet be astonished at the still lower price that paper will touch when certain new inventions now in process of introduction shall have come fully into operation, but there seems to be no probability that the demand will again outstrip the supply. Mr. Lockwood argues that the recent multiplication of newspaper circulations is exceptional, and says:

The future supply and
cost of printing paper.

The newspapers are increasing in number and circulation, but the same percentage of increase that has obtained during the past two or three years in connection with the press will not in all probability continue. The marked increase of late years has been very largely owing to the law which allows publishers to send through the mails at pound rates all of the specimen copies that they choose to mail. This has in a measure regulated itself, and for this and other reasons I draw the conclusion as stated.

The practice to which Mr. Lockwood refers as a cause for the great recent increase in the number of newspapers printed is a practice which is as certain to continue, with the continuance of the post-office regulation in question, as the publication and competition of newspapers continue. It is a practice more likely to increase than to diminish. At the same time it is not to be questioned that the present capacity of the paper-mills of the United States is equal to the home demand. That the manufacturers themselves realize the fact is indicated by a concerted movement among them to increase the export of American paper. It is already demonstrated that news paper of a medium grade can be laid down with a profit in London, and there are to-day several Scotch and English journals regularly printed on American-made paper. (a)

The chief cause of the reduction in the price of news paper is the successful use, first, of straw, and more recently of wood pulp, as ingredients of manufacture. There are not rags enough obtainable to manufacture the paper now annually consumed in the United States. Wood pulp is now mixed with rag pulp in proportions which vary from 15 to 50 per cent., according to the quality of the paper desired. In the great bulk of the paper now used by the American press there is from 40 to 50 per cent. of wood pulp. The paper thus manufactured is not as durable as the all-rag paper, and does not retain its color as long, but it answers the transient purpose for which it is employed as well as the higher-priced paper which the press was compelled to use for lack of a cheaper quality before American skill and enterprise brought the manufacture of wood pulp to its present state of perfection. (b)

Wood-pulp paper.

WAGES.

The relation of wages to the gross product remains to be considered. The statistics of wages paid in the making of newspapers and periodicals are given in detail in the same table with the gross product (Table IV). The amount paid annually in wages by all the newspaper establishments in the census year was \$28,559,336 38, of which \$17,813,053 38 was paid by the daily establishments and \$10,746,283 by all others, the percentage for the United States being 62.37 for dailies and 37.63 for all other

Wages.

a As the trade of the world increases, so does the newspaper press. It is estimated that there are from 32,000 to 35,000 newspapers printed and published in all countries. This country is credited with about 11,000 to 12,000. The remainder are mostly European, and the chances of supplying them with American paper may be small; but the press of South America and the colonies is by no means insignificant. This is especially the case with many journals published in the Australian colonies. As possibly of some interest to the manufacturers of news paper who may be present, I have with me some copies of foreign papers. I do not think that any paper-maker present would object to receive a contract for such papers as the Melbourne *Argus*, Sydney *Herald*, etc.—Howard Lockwood, before American Paper Makers' Association.

b In regard to the average price of printing paper given in the text, it may be stated that in the latter part of the year 1880 the average price paid for paper by twenty of the leading dailies of New York city was $7\frac{3}{4}$ cents per pound, the highest price—9 cents—being paid by the *Daily Graphic*, which requires for its illustrations an extra fine paper, and the lowest price paid, $6\frac{1}{2}$ cents. The paper used on the New York dailies is a better average paper than that generally used by American newspapers, but the large quantities in which it is purchased allow of better contracts as to price than can generally be made.

classes. The average wages paid by each establishment was \$20,105 03 for the dailies and \$1,476 75 by the publications of every other description, the gross amount being paid to 71,615 persons, of whom 51,140 were males and 3,875 were females, 16,600 of whom were employed in editorial work. Persons employed. The average wages paid to each individual were \$398 79 per annum, the value of wages for each \$100 of gross product was \$32 09, and the product per capita, gross, was \$1,242 88.

In comparing these results with the relations of wages to product in industries of the first group (as determined by the Ninth Census) I find the dollars in wages paid for each \$100 of gross product to be considerably lower than it then was in industries of this group (\$51 30), while the product per capita, gross, in the same comparison is much higher, the figures given in the Ninth Census for this latter proportion being \$843 51. This difference is the more striking from the fact that the labor employed in the printing business is skilled labor, capable of earning in large establishments, under favorable conditions frequently arising, large wages by piece-work, while the salaries paid to editors naturally average much higher than the earnings of mechanics or laboring men in any field of industry. Some criticism, indeed, may rightly lie against these statistics, because they include among the employes the persons engaged in editorial work upon the newspaper press and include their earnings in the amount of wages paid. Editorial employes. The difficulty, however, is one which was found to be unavoidable in the compilation of the statistics. It is the rule in nearly all the newspaper establishments of the United States to include the compensation for editorial work upon the regular pay-roll, and any separation, had it been asked for, could not have been secured with approximate accuracy. Another difficulty also appeared in the fact that in a large number of the local newspaper establishments of the United States the editorial work and portions of the mechanical work are performed by the same persons. Bearing this fact in mind, it will be seen that the total of 16,600, which is given as the number of persons engaged in editorial writing in the United States, includes many who are printers as well as editors.

EDITORIAL EMPLOYÉS.

Any attempt to average the number of editors employed to the number of newspapers published would be misleading. Upon the local weekly press above spoken of the entire editorial work is usually performed by one individual, and the fact that so large a proportion of these journals were founded and are owned by practical printers, whose entire education has been at the case, is sufficient explanation of the low order of literary work which characterizes a large number of these papers. They are the work of practical printers, and not of educated and trained editors, the more prosperous weekly journals, which are well located for business, employing one or more men or women for the conduct of their editorial work.

The editorial force employed upon the daily newspaper press varies in size according to circumstances. Upon many of the smaller dailies of provincial towns two or three persons are sufficient to accomplish all the work that is done, one of whom generally devotes his entire attention to the local columns. As the towns and the journals increase in size and character, the editorial force increases correspondingly, and its Editorial force of daily newspapers. number generally bears some ratio to the circulation. Thus daily journals which circulate from five to ten thousand find it necessary to employ editorial assistants varying from six to twelve in number. In the metropolitan newspaper offices the forces are divided more distinctly into editorial and reportorial, and the men in each division are engaged exclusively upon their distinctive kind of work. The reportorial force of a metropolitan newspaper frequently numbers fifty men, many of whom are educated and skillful writers. The work of the editorial force proper is divided between editorial writing, exchange reading, the condensation and preparation of news, the editing of telegraphic news and correspondence, etc. Much of the work upon our best newspapers is done outside of their offices by trained experts in special topics of comment or discussion, who are paid for their contributions by the piece. It has long been the habit, however, to secure for editorial work men who have education and experience, and are capable of doing the best literary work that money will pay for; and journalists of established reputation receive salaries as generous as are paid in any profession in the United States. Much of the editorial work of the modern newspaper is paid for by the piece, even when done by editors regularly employed, and this is more frequently the case with those engaged in the purely reportorial duties of the newspaper.

This wage table reveals the fact that only in the states of California, Colorado, Connecticut, Delaware, Georgia, Kentucky, Louisiana, Maryland, Missouri, Nevada, Ohio, Pennsylvania, Rhode Island, Tennessee, and Texas did the daily press equal or exceed in gross receipts the earnings of the periodicals of other periods of issue. In the District of Columbia and the territories of Arizona, New Mexico, Utah, and Wyoming the same fact appears. In most of these states the population is largely congregated in cities, particularly in Delaware, Connecticut, and Rhode Island; in others the population is so widely scattered and so sparse that it is only in the cities and large villages that there is any great opportunity for newspaper publication, as is the case with Louisiana, Colorado, Missouri, and Tennessee. Nevertheless the aggregate earnings of the dailies (which necessarily includes the earnings of all the weeklies, etc., connected with the dailies) are less than two million dollars behind those of all other classes of publications. In connection with this comparison, it should be observed that the daily establishments pay out in wages the sum of \$17,813,053 38 annually, against \$10,746,283 paid out for wages annually by newspaper and periodical establishments of every other class. This apparent discrepancy is easily explained by the fact that in a very

large proportion of the local weekly newspaper establishments the proprietor is himself a practical printer and makes no account of his own labor in his return of the amount of wages paid annually. From a large number of these establishments it was reported to the Census Office that no wages were paid, as was verily the case, the proprietor himself setting all the type and doing all the press-work needed to publish a newspaper, with the aid of the co-operative sheets or patent outsides. In other cases members of the proprietor's family, sons, and frequently daughters, set the type and did the work without pay; and in still other cases, and of these the proportion was still larger, the wages reported would average as low as \$75 to \$150 per annum, the only assistant required to make the paper being an apprentice, whose board and lodging may have been added to the above cash remuneration. In this way it has turned out that in a total wages of \$28,559,336 38 paid annually the daily establishments paid 62.37 per cent. and the weekly and other periodicals 37.63 per cent., while the latter earned 50.90 per cent. of the total gross receipts. It will be observed that the states in which the amount paid out annually in wages by the weeklies exceeded in amount the wages paid by the dailies were Alabama, Florida, Iowa, Kansas, Kentucky, Maine, Mississippi, North and South Carolina, Vermont, and West Virginia. There are therefore left thirteen states, viz, Arkansas, Illinois, Indiana, Massachusetts, Michigan, Minnesota, Nebraska, New Jersey, New York, Ohio, Oregon, Virginia, and Wisconsin, in which the weekly press, while earning larger aggregate gross receipts than the daily press, nevertheless paid out less money annually in wages.

AMOUNT OF TYPE SET.

Table V shows the average and aggregate ems of type set per issue in the publication of newspapers and periodicals in the United States during the census year. These figures require some discussion in connection with the subject of wages. In all piece-work book and newspaper composition is counted by ems in the United States, the American system differing in this respect from the English and French systems, which aim, although by somewhat imperfect methods, to base composition on the exact number of letters set up. (a) The em, it will be understood, is the square of the body of a type, and as a basis of computation arrives at substantially the end sought for in the other systems, while it guards against inequalities by extra charges for composing unusually lean letter or letter of inconvenient sizes, or matter set in unusually narrow measures.

It is an almost uniform rule that the composition upon the daily press in this country is paid for by the piece, while upon the weekly and periodical press the prevailing custom is to pay weekly wages where the work is done by journeymen printers, whose time is also occupied with making up, imposing, and with the job-work, which forms so large an item in the business of country newspaper offices. The rates paid for composition for piece-work vary largely in different parts of the United States, and are in accordance with fixed standards for work on morning and evening newspapers—the latter, which is day work, being uniformly lower than the former, the price paid for type-setting running all the way from 20 and 25 to 60 cents per thousand ems. The lower rates are paid in some localities to female compositors, the employment of whom has been gradually increasing of late years. No data were obtained by which the true average can be indicated, and it is suggested as a feature of the investigation which may properly be added in the preparation of the press schedules for the next federal census.

The chief purpose of these statistics of the number of ems of type set is to convey an accurate idea of the actual amount of reading matter newly prepared and submitted with each issue of the American press. The average amount of type set per issue of the daily press was 74,147 ems, and the aggregate set each day by the entire daily press of the country was 66,140,266 ems. The significance of these statistics can be indicated to those not familiar with the details of newspaper publication by some comparisons.

The average number of ems set per issue by the daily press (74,147) is equal to twenty-nine pages of an ordinary octavo book set in brevier type, or to a volume of 48½ pages set in long primer type. I have used these two styles of type in illustration because they are commonly employed in book composition. It may be added that, while much brevier and considerable long primer are still used on the daily newspaper press of the United States, the tendency for many years has been toward the smaller fonts, and minion is the style now most generally used in the large newspaper offices for ordinary reading matter, advertisements, and frequently other matter, being set in nonpareil or agate. The average number of ems set per issue on weekly, monthly, and other publications (57,197) is equal to twenty-two octavo pages of brevier and thirty-seven of long primer. It should be added that this average is slightly higher than it would have been for the weekly press alone, by reason of its including the type set in the publication of the several monthly magazines, which print a large quantity of reading matter.

The aggregate number of ems set per issue by the daily newspaper press of the United States (66,140,266), that is to say, the amount of type set daily by all the daily newspapers in the country, is equal to 25,907 octavo pages in brevier type, or 43,179 pages in long primer type. The aggregate set per issue by all the other periodicals of the country (490,753,756 ems) is equal to 193,897 pages of brevier type and 320,754 octavo pages of long primer type.

In other words, the total amount of reading matter contained in one issue of all the newspapers and periodicals published in the United States is equal to the contents of a library of from 1,000 to 1,200 volumes.

To set this amount of reading matter there were in use in the several newspaper establishments 6,689,878 pounds of type (Table V) of all varieties. This aggregate does not include the type used in the composition of a considerable number of periodicals which did not do their own printing, but let it by contract to job-offices. Pounds of type used.

The quantity of type in use in the newspaper offices has never before been calculated. When in constant use, type will last, under the process of replenishing known as "sorting up", for a longer or shorter period, according to the use that is made of it, but in the average local weekly newspaper office a font of type is made to do service for an indefinite number of years. Much of the type whose impression is seen in the census newspaper file for 1880 is as worn and dirty as any that appeared in the colonial press of the United States, when the cost of new supplies was much greater than now, and was still further increased by the risks of importation. The average daily newspaper, printing from 2,000 to 5,000 copies per issue, will exhaust a font of type ordinarily in from six to ten years, and the larger the edition regularly printed the greater the wear and tear and the sooner the replenishing must come. This remains true until we come to newspapers and periodicals whose forms are stereotyped. The process of stereotyping saves the type from the jam and friction of the press, keeps it uniform, and permits a newspaper to maintain its cleanly and handsome appearance for many years without restocking, beyond the occasional "sorting up".

ADVERTISEMENTS AND SALES.

Strictly speaking, there are but two sources of newspaper revenue: subscriptions, or sales, and advertisements. One of the most interesting and valuable of the inquiries in this department was to determine the true proportion of the receipts of newspaper publishing from these two sources. Estimates have frequently been made, which, however, have been based upon the experience of individual concerns, and have differed from the present results. The two sources of newspaper revenue.

It is believed that the figures now supplied are accurate. They show that of the total gross proceeds of \$89,009,074, 56.03 per cent. were from sales of papers. The following figures, which are Comparative receipts from subscriptions and advertisements, compiled from the data presented in Table IV, indicate in detail the comparative receipts from the two sources for daily journals, for publications of all other classes, and for the aggregate:

DAILIES.	
Receipts from advertising (49.17 per cent.)	\$21,487,676
Receipts from subscription (50.83 per cent.)	22,214,437
WEEKLIES AND ALL OTHERS.	
Receipts from advertising (38.95 per cent.)	17,648,630
Receipts from subscription (61.05 per cent.)	27,658,331
AGGREGATE.	
Receipts from advertising (43.97 per cent.)	39,136,306
Receipts from subscription (56.03 per cent.)	49,872,768

By multiplying the total aggregate circulation of the daily newspapers (3,566,395) by the average subscription price of all the dailies (\$7 27) we reach a total of \$25,927,691 65, which would be the actual receipts of the daily press from sales if the total editions printed were uniformly disposed of for cash. The difference between this sum and that arrived at by the other method of calculation (\$22,214,437), based upon the division of the reported gross product between advertisements and sales, may be taken as representing, first, the actual loss to publishers on circulation growing out of the free lists, including exchanges, the tear and waste, and the papers remaining unsold; and in the second place, the margin of profit to the middle men, the news agents and companies and newsboys, for the handling of the papers, the compensation of the latter being the difference between the wholesale and the retail price of the papers they vend. It is to be borne in mind that a considerable percentage of the total daily circulation is disposed of at retail by the single copy through street and stand sales. While the average cost to the annual subscriber to the daily newspaper was 2½ cents per copy, the average retail price, not indicated in the tables, was found to be nearly 4½ cents for the whole country. The actual sum paid out annually for daily newspapers by the people of the United States is therefore more nearly the larger than the smaller of the totals given above. The receipts of publishers for sales of papers and periodicals of all other periods of issue than daily were \$27,658,331, representing the income derived from the yearly issue of 28,213,291 papers and periodicals printed. The total receipts were therefore \$49,872,768, a sum considerably less than that actually paid out by the people of the United States in the census year for their periodical reading matter. The American public contributes nearly as large a sum to the support of the newspaper and periodical press in the way of advertisements as for the papers themselves. Receipts from subscriptions.

By referring to Table IV it will be seen that the proportion paid for subscriptions and for advertisements varies in the several states, and as between the daily newspapers and all other classes of periodicals; but in the main the figures hover closely to the even proportions. It is noticeable that the percentage of receipts from advertising averages somewhat higher for daily papers in the western than in the eastern states, and particularly in the territories, where the sparseness of population reduces the volume of circulation in a slightly larger ratio than it does the price charged for advertising.

Attention is directed to the fact that the averaging of advertising receipts is misleading, because of the great disparity in the advertising patronage of different publications in the same localities. Thus, in the making of the average for publications other than daily, many periodicals appear which print no advertisements at all. Business of this kind runs in certain channels, which accord with the public judgment of the value to be received from the expenditure involved. The value of an advertisement to an advertiser depends not more upon the number of persons who are likely to read it than upon the supposed character, occupation, or wants of those readers. It long since became an accepted rule that advertising rates may vary in proportion as the circulation of the journal is large or small, and that journals which circulate chiefly among a particular class of people, or among people engaged in a particular line of business, may secure higher rates from that line of advertisers accordingly.

Comparative receipts from advertisements and subscriptions.

Averaging of advertising receipts misleading.

Nature of advertising.

THE DEVELOPMENT OF NEWSPAPER ADVERTISING.

There are no statistics in previous censuses which afford a basis for comparison with those now given as to the receipts of the newspaper press from either of its two sources of revenue. Some indication of the great increase in the value of newspaper advertising may be gained from a comparison of the figures now given with those obtained from the income tax on advertisements in the years 1863, 1864, 1865, 1866, and 1867. The tax was imposed at the rate of 3 per cent., and the income derived by the government from this source in the several years was as follows:

The income-tax on advertisements.

1863.....	\$40,628 59	1866.....	\$290,605 31
1864.....	133,315 11	1867.....	288,009 80
1865.....	227,530 21		

In 1867 the tax paid on advertisements was on receipts which amounted to \$9,600,323, as against receipts aggregating \$39,136,306 in 1880. By way of indicating the growth in advertising patronage in the several states the following table has been prepared from the returns of the internal-revenue office for 1867 and the returns to the Tenth Census:

States and Territories.	1867.	1880.	States and Territories.	1867.	1880.
Alabama	\$52,819 33½	\$220,665	Missouri	\$449,015 00	\$1,710,241
Arizona		58,000	Montana		84,130
Arkansas		182,201	Nebraska		391,825
California	340,336 00	2,150,917	Nevada		215,139
Colorado		567,442	New Hampshire....	23,546 00	179,015
Connecticut.....	80,717 00	460,070	New Jersey	46,187 33½	694,157
Dakota		128,026	New Mexico		35,883
Delaware	1,448 00	91,983	New York	3,318,415 66½	8,674,173
District of Columbia	164,170 33½	225,928	North Carolina.....		178,324
Florida		66,659	Ohio	687,153 66½	2,460,642
Georgia	35,017 00	468,511	Oregon	28,494 33½	177,095
Idaho		19,190	Pennsylvania	1,311,456 33½	4,218,770
Illinois	526,871 33½	3,179,954	Rhode Island.....	64,525 00	244,155
Indiana	48,244 00	1,057,688	South Carolina	100,767 66½	145,907
Indian territory		2,990	Tennessee.....	175,657 00	373,450
Iowa	22,716 33½	1,150,806	Texas		570,089
Kansas		591,723	Utah	3,069 00	81,270
Kentucky	199,990 33½	671,884	Vermont	5,451 00	102,619
Louisiana	458,061 66½	617,262	Virginia.....	77,754 00	356,204
Maine.....	45,454 33½	214,394	Washington.....		48,840
Maryland	229,964 33½	859,847	West Virginia.....	22,344 00	169,280
Massachusetts	839,990 66½	2,512,522	Wisconsin.....	97,622 00	754,920
Michigan	105,836 66½	1,002,092	Wyoming		32,950
Minnesota	37,228 00	524,540	Total.....	9,600,323 33½	39,136,306
Mississippi.....		211,934			

The defective character of the internal-revenue returns is sufficiently evident from an inspection of the above figures; and the comparison, while it is the best that can be made, does not give accurate indication of the growth of this source of newspaper revenue. The increase has, however, been sufficiently large to excite attention, and it speaks for the increasing confidence of the American business public in the utility of printers' ink. Another great aggregate of money, not, however, as large as this, is

Growth of newspaper advertising.

expended every year in the printing of advertising circulars and hand-bills for gratuitous distribution and posting. Various attempts have been made at different times to estimate the actual number of newspaper advertisements published within a given period, but the inutility of such an inquiry has deterred from any attempt in that direction, and no accurate calculation can be based upon the aggregate of cost. The advertisements inserted vary in price all the way from five cents for one-line advertisements in country newspapers to enormous contracts, for a longer or shorter period, at prices varying from \$100 to many thousands of dollars. The New York *Herald* has stated that the charge for a column advertisement on its fifth page for one year is \$109,500, and single advertisers have been known in certain instances to make contracts involving the expenditure of half a million dollars in advertising in a year. The following statement of the number of advertisements inserted in the Sunday issues of five New York papers on a single day during the census year will give an indication of the variety and extent of the individual patrons of this department of the newspapers:

The cost of newspaper advertising.

Papers.	Number of columns of advertisements.	Number of advertisements.	Average per column.

6 Dollars Reward.

Run away from the subscriber, on the 15th of November last, a Negro man, named TOM, about 24 years of age, rising 5 feet high, is much marked with the small pox, speaks English & Low Dutch, wore away and took with him a brown broadcloth coat, a leather jacket, olive coloured velvet breeches, and a round felt hat—he plays on the fiddle. The above reward and all reasonable charges will be paid to whoever will take up said negro and return him to his master, or secure him in any jail so that his master can have him again.

December 10, 1790.

N. B. Said Negro has a wife and family at Jamaica, and 'tis supposed he is lurking about that place.

FIG. 1.

The business of newspaper advertising has been in a process of evolution from the founding of the American press—a process still in continuance. Its simplest form was that which first appeared: the few short advertisements of the colonial press, of wants, of runaway slaves, of ships to sail, and the like. Competition between advertisers was to come with the competition between newspapers.

Evolution of newspaper advertising.

It had begun before the revolution in the modest recital by merchants of the character of their goods. As this advertising increased it gradually sought out unique methods of attracting attention, such as rude illustrations with wood-cuts of ships, houses, horses, stage-coaches, animals, and frequent allegorical pictures, such as cuts of the Muses. The cut shown in the illustration (Fig. 1), was very frequently seen in northern newspapers about the beginning of the century. With these illustrations came type display, the use of large and

unusual letters to rivet attention, and finally the resort to every variety of linguistic ingenuity in the wording of the announcement to be made. The American press has not yet outlived either of these advertising characteristics, which have reached in the United States a fecundity of form and manifestation undreamed of in the press of other countries. The free use of stereotype plates, and the cheapness with which they can be indefinitely duplicated, has been powerful to spread the pictorial advertising and to develop the use of monstrosities in the shape of enormous and suggestive cuts, which defy the requirements of the typographic art and of journalistic taste. But there are many American journals, both daily and weekly, which have long refused to laden their columns with these devices of the advertiser to get undue advantage over fellow advertisers. They have refused on the two grounds that they are in defiance of the requirements of typography and a detriment to the interests of other advertisers. As a rule, these same journals refuse any extravagant or grotesque display of advertisements. They are the only class of American newspapers which can be compared in typographic character to the average newspaper, daily or weekly, published in England, and it is to be regretted that their number is not larger. They are steadily increasing, however, and this rule in regard to advertisements already applies to practically all the better class of newspapers which have become independent in their financial condition.

Objectionable advertising methods.

Arbitrary circumstances frequently determine the direction of special advertising. Thus, in New York city, at one time the auctioneers, who were appointed for partisan considerations, were in the habit of sending all their advertisements to a particular paper of their political faith, where the public quickly learned to find them. In the course of time the journal in question ceased to be of that particular party, and the auctioneers ceased to be appointed by law; but the same journal continued nevertheless to have a practical monopoly of the auction advertisements, because to that paper all those who bought or sold at auctions were looking for this class of information. In 1843 the New York *Courier and Enquirer* was benefited by an official order requiring all notices of proceedings in bankruptcy under the bankrupt act of 1842 to be printed in its columns, nominally on the ground that it had the largest circulation, although in reality there were at that time at least two New York dailies each with a circulation of more than double that of the *Courier and Enquirer*. The struggle for the official advertising is constant and intense in many cities and counties, and the partisan considerations which frequently determine its award are one of the chief reasons of the close connection that has always existed between parties and the press in this country, as well as an obstacle to the development of an independent and self-reliant journalism.

Arbitrary determination of advertising values.

At one time the London daily press was distinguished for its different lines of advertisements, of which Stuart wrote: "In 1802 and afterward particular newspapers were known to possess particular classes of advertisements: the *Morning Post*, horses and carriages; the *Public Ledger*, shipping and sales of wholesale foreign merchandise; the *Morning Herald* and *Times*, auctioneers; the *Morning Chronicle*, books." (a) There is in London to-day a paper of immense dimensions, and believed to be unique, which is wholly and exclusively devoted to the publication of cheap advertisements about individual wants, sale and barter, etc., and this paper, with a trifling circulation, secures the greater part of that class of cheap advertising in London, chiefly because it has come to be known as the natural place to look for it.

THE COST OF ADVERTISING.

The cost of advertising varies with all these varying conditions. In the colonial press it was rarely that a newspaper made any publication of advertising rates, it being customary to announce, instead, that advertisements would be "taken in" at "reasonable rates" or a "moderate price". The inference is fair that the early printers were glad to get what they could for this kind of business, and it is certain that no such thing as a fixed standard of advertising rates was ever arrived at among them.

Some illustrations may be given: The *Virginia Gazette* announced that "advertisements of moderate length would be inserted for 3 shillings the first week and 2 shillings each week after". The *Maryland Gazette* promised to publish "advertisements of moderate length for 5 shillings the first week and 1 shilling each time after, and long ones in proportion". The *New Jersey Gazette*, as late as 1777, inserted "advertisements of moderate length for 7 shillings 6 pence for the first week, 2 shillings 6 pence for every continuance, and long ones in proportion".

Only in Philadelphia before the revolution was advertising a source of considerable profit to publishers. In both Bradford's and Franklin's papers it became such. It was a long struggle in later years to bring it to a point of large remuneration. Space for advertisements in the "blanket sheets" of the earlier daily journalism of New York city was not only sold at very low rates, but was often given away. Thirty-two to forty dollars per year, with a copy of the paper thrown in, would secure for the advertiser as much space as he demanded, (b) and advertisements would often appear many days after they were out of date. As the volume of advertisements increased prices increased with them, and the existing system of classification in publication gradually grew up.

The business of newspaper advertising has grown to be so enormous that its negotiation has become a separate and profitable business. There are more than fifty firms in the United States engaged in the advertising-agency business, and these agencies secure a basis of discount from the regular rates of many newspapers all over the country. With this advantage they are able to negotiate the business of large and systematic advertisers to the profit of the latter as well as of themselves, and frequently carry out contracts involving an expenditure of a million dollars in printers' ink. I have elsewhere described the manner and extent to which the business of co-operative newspaper printing is connected with this system of extended advertising. (c)

The value of an advertisement to the party interested depends upon the number and character of the persons whose eyes it is likely to reach through the chosen medium, and rates of charges are determined in accordance with the reputed circulation of the several journals. A certain class of trade journals may charge an increased rate, not proportionate to their actual circulation, because they reach a particular class of readers, interested in the trade to which the journal is devoted. Rates are also adjusted so that the advertiser for a long period of time gets the benefit of a regular discount on each separate insertion. Different prices are charged for insertion in different portions of the paper, the rate varying according to the conspicuousness of the position assigned. The willingness of advertisers to accept all the advantages which may accrue in this manner has led to a very general habit among journals of a certain class of selling any portion of the paper, including the regular news columns, and not infrequently the editorial

a Hunt's *Fourth Estate*, vol. ii, p. 118.

b Hudson's *History of Journalism*, p. 408.

c It was under the auspices of these advertising agencies that the publication of newspaper directories began in the United States. The first known publication of this kind in the United States was *The Newspaper Record*, containing a complete list of newspapers and periodicals in the United States, Canadas, and Great Britain, by Lay & Brother, Philadelphia, 1856. In 1846 C. Mitchell began in London the publication of his *Newspaper Directory of Great Britain*, which has continued annually ever since. In 1869 George P. Rowell & Co., of New York, began the publication of the *American Newspaper Directory*, the first regular publication of the kind in the United States, and they have since continued it annually. S. M. Pettengill & Co., New York, have published several annual editions of a *Newspaper Directory and Advertisers' Hand-Book*. H. P. Hubbard, of New Haven, Connecticut, began in 1879 the publication of Hubbard's *Right-Hand Record and Ready Reference*, being a directory of United States and Canadian newspapers, with their circulation, the population of the towns in which published, etc. In 1881 Mr. Hubbard greatly enlarged and improved his directory, including in it carefully collected statistics of all the newspapers published in the world. N. W. Ayer & Son, Philadelphia, began in 1880 *The American Newspaper Annual*, and C. A. Cook & Co., Chicago, *The United States Newspaper Directory*. There are a number of minor publications of like character in the United States. The special agent of the Census Office in charge of the statistics of the press is under obligation for much information and many courtesies to Mr. H. P. Hubbard, of New Haven, and George P. Rowell & Co., New York.

indorsement, for a price. This habit is recognized as one of the distinct evils which detract from the otherwise high character of the American newspapers, and it is not tolerated in the offices of prosperous and wealthy journals, which occupy a position that enables them to dictate terms to their patrons, or in the offices of many smaller establishments, whose proprietors prefer the slightly smaller gain to the imputation of willingness to sell their columns and their opinions for money.

THE PRICES OF NEWSPAPERS.

The prices at which newspapers are published in the United States vary in accordance with certain conditions which are coming to be well defined, there having been marked variations since they first became a common institution. When they reached the point where they could be considered profitable establishments they were, as a rule, sold for 6 cents per copy, or \$10 per year. This was the case with the old blanket sheets that preceded the newspapers of the present sizes and shapes in the metropolis, such as the *Morning Courier*, afterward the well-known *Courier and Enquirer* (which passed into the *World* by absorption in 1861), and the *Journal of Commerce*, still in existence. Both of these papers were established in 1827, and after a while came to be regarded as the leading dailies of the metropolis, their circulation, which was regarded as large for that time, varying between 4,000 and 5,000 daily. They were folio sheets, 24 by 35 inches at first, and afterward 35 by 59 inches. In 1850 the *Courier and Enquirer* published a sheet which contained 1,881 square inches, and in 1853 the *Journal of Commerce* reached a size of 2,057 square inches. Both journals boasted that they published the largest papers then printed in the world, and a calculation has been made which shows that either one of them at that time printed nearly half as much more reading and advertising matter, measured by ems, as the *London Times*. The daily composition on one of these "blanket" sheets, as they were appropriately called, often exceeded 700,000 ems—a large composition for one of the most enterprising newspapers of the present day. These journals were known as the "six-penny" papers, and the evening papers printed in New York at the time were sold at the same price. There is no question that, in consideration of the amount of reading matter they contained, they were cheap papers for the money; but they were not cheap in the other sense, and their contents were not of a kind to attract the general public to their reading. Being largely given over to advertisements, mainly contracted for by the year, the reading matter was adapted to the mercantile taste of the metropolis, as their circulations were confined very closely to the counting-rooms, and the great average public did not read them.

Variable prices of newspapers.

The six-penny blanket sheets.

THE PENNY PRESS.

It was the realization of this fact, and the belief that it was possible to print a paper which should be cheap enough to find purchasers among the laboring classes and contain reading matter enough to make it worth their while to buy, without at the same time costing more than its income, which led to the conception of the penny newspaper. The first of these in New York was the *Morning Post*, which was established January 1, 1833, by Horatio David Shepard, with Horace Greeley and Francis V. Story as partners, printers, and publishers. The penny newspaper had been previously undertaken in England, where the *Orange Postman*, which sold for one cent, was founded as early as 1706. At the time of its first establishment in New York city the penny newspaper was beginning to make decided headway against the larger and expensive London dailies. The *London Illustrated Penny Magazine*, which had been started in 1830, was meeting with a phenomenal success, although it had none of the characteristics of a newspaper, and it was even imported and sold in large quantities in New York city. One or two spasmodic efforts to start penny dailies had also been made in Boston and Philadelphia previous to the appearance of the *Morning Post* in New York, but both efforts speedily failed. (a) Such, indeed, was the fate which overtook the *Morning Post*, whose projectors and partners combined could only gather together capital enough to keep it afloat for about a month. In September of the same year the *Sun* was established by Benjamin H. Day, (b) a practical printer, who promised in his prospectus to

The penny press.

English penny papers.

The New York Sun established.

^a As late as 1845, when the *Traveller*, a two-cent daily, first appeared, all the Boston dailies were six-cent papers, and none were sold by newsboys on the streets.

^b At a banquet in New York, in 1851, Mr. Day said, in response to a toast:

"It is true I originated the *Sun*, the first penny newspaper in America, and, as far as I have known, the first in the world; but I have always considered the circumstance as more the result of accident than of any superior sagacity of mine. It was in 1832 that I projected the enterprise, during the first cholera, when my business as a job printer scarcely afforded a living. I must say I had very little faith in its success at that time, and from various causes it was put off. In August, 1833, I finally made up my mind to venture the experiment, and I issued the first number of the *Sun* September 3. It is not necessary to speak of the wonderful success of the paper. At the end of three years the difficulty of striking off the large edition on a double-cylinder press in the time usually allowed to daily newspapers was very great. In 1835 I introduced steam-power, now so necessary an appendage to almost every newspaper office. At that time all the Napier presses in the city were turned by crank-men, and as the *Sun* was the only daily newspaper of large circulation, so it seemed to be the only establishment where steam was really indispensable. But even this great aid to the speed of the Napier machines did not keep up with the increasing circulation of the *Sun*. Constant and vexatious complaints of the late delivery could not be avoided up to the time that I left the establishment and until the invention of the press which permitted the locking of the type upon the cylinder."

publish all the news of the day at the price of one penny per copy, or \$3 a year, and he kept his promise. The first number was a folio of twelve columns, with about 10 inches to the column, its contents being largely confined to brief accounts of local happenings. It was not at the beginning edited with special ability, tact, or expenditure, and its success, which dated from the first issue, may therefore be said to be due to the fact that it had discovered a positive want on the part of the people, which it did much to meet. The success of the *Sun* led to

New York daily press
in 1835. The New York
Herald established.

the founding of numerous other penny papers, so that in 1835 the dailies of that city consisted of seven six-penny morning papers, four six-penny evening papers, and five penny papers—fifteen in all. (a) The *Herald* was established on May 6 in that year by James Gordon Bennett, (b) and thereafter the *Sun* and *Herald* ran a race for the support of the masses. The *Sun* continued to be published at the rate of one cent a copy until the outbreak of the war, when the sudden increase in prices compelled the proprietors to increase the price to two cents a copy, where it has since remained.

Since that time there have been a number of penny newspapers started in New York, one of which, the *Daily News*, now boasts of an enormous circulation, but the most of them have died. Beside the *Herald*, the *Tribune*, *Times*, and *World* began at one cent, but as these expanded in circulation and increased in resources they advanced their price to accord with their advancing value. Penny papers have been and are published in other large American cities; (c) but the tendency of the public, for an obvious reason, has been somewhat away from so cheap a journal. (d) The penny papers continue to be inferior to their higher-priced competitors in a degree which is hardly in proportion to the difference in price. They are small and poorly printed, and their news is meager; and such must, of necessity, continue to be the case, except where the circulation can be run up to a figure which none of them have yet been able to reach in this country.

Penny papers no longer
most popular.

The two, three, and four cent papers, on the other hand, with their added revenue from sales, are able to publish journals which are not only typographically excellent, but contain a wide range of well-digested reading matter, and thus become marvels of cheapness, offering so much more for the money that the public generally comes to look upon the difference in price as of less importance. Four cents is now the ruling price for a daily newspaper in most of the larger cities of the United States, and it is rare in any eastern city that more than five cents per single copy is charged. Frequently in cities where one or more five-cent papers are published there may be found a three-cent paper existing in prosperity by their side. The annual subscription price of these papers varies from \$6 to \$10, and the average annual price of daily papers in the country has been found by this inquiry to be \$7 27. (e)

The higher priced
dailies.

The penny press had its origin in the energy and enterprise of practical printers, who were generally men without capital and without political connection. Their career has, as a rule, been a short one; for even in the earlier days of journalism it was the exception and not the rule when a metropolitan daily, started without capital, was able

a The names of the New York dailies at this time were as follows:

Six-penny morning papers: New York *Gazette and General Advertiser*, *Mercantile Advertiser* and New York *Advocate*, New York *Daily Advertiser*, *Morning Courier* and New York *Enquirer*, New York *Journal of Commerce*, New York *Times*, *Business Reporter* and *Merchants' and Mechanics' Advertiser*. Six-penny evening papers: New York *Commercial Advertiser*, *Evening Post*, New York *American*, *Evening Star*. Penny papers: *Sun*, *Transcript*, *Man*, *Jeffersonian*.

b The first issue of the *Morning Herald*, "James Gordon Bennett & Co.," publishers, appeared in New York May 6, 1835, price one cent. It was a four-page paper, 30 by 24, and therefore not much larger than the ante-revolutionary papers. It contained four columns to the page, closely set in minion, and four of its sixteen columns were given over to advertisements, which the publishers announced their purpose of printing at the rate of \$30 a year per square of 16 lines, or 50 cents for one insertion per square. In the modest editorial salutory the editor declared his intention to print an independent newspaper for the masses with a prophetic quotation from *Ophelia*: "We know what we are, but know not what we may be." He added that "there are in this city at least 150,000 persons who glance over one or more newspapers every day. Only 42,000 daily sheets are issued to supply them. We have plenty of room, therefore, without jostling neighbors, rivals, or friends, to pick up at least 30,000 or 40,000 for the *Herald*, and leave something for others who come after us. By furnishing a daily paper for the low price of \$3 per year, which may be taken for any shorter period at the same rate, and making it at the same time equal to any of the high-priced papers for intelligence, good taste, sagacity, and industry, we expect to reach this end".

In a notice of a directory just published the first *Herald* alludes to the fact that in New York "we have 35 daily papers, 16 of which in the city issue 17,000 large sheets daily and 25,000 small, the best large morning daily being the *Courier and Enquirer*, and the best small one the *Herald*, to say nothing of the good old wine of the *Star*". This first diminutive and unpretentious *Herald* contained, besides this directory notice, a column of European news from the steamer *St. Andrew*, from Cork, which arrived on the evening previous, and "brought dates to the 8th of April", nearly a month previous to the date of its publication. There were two or more columns of city intelligence, and the first and last pages were embellished with sketches, a poem or two, and other miscellaneous reading matter. The contrast between it and the earlier dailies was marked enough, but nothing like the comparison with a *Herald* of to-day.

c The first penny newspaper issued in Philadelphia was the *Daily Transcript*, commenced in 1835 by W. L. Drane & Co.—Colton.

d A conspicuous exception to this tendency is seen in the success which has attended the journalistic enterprises of the Scripps Publishing Company, of Detroit, Michigan. This company now publishes five penny newspapers, one in Detroit, established in 1873; one in Cleveland, Ohio, established in 1868; and one in each of the cities of Saint Louis, Missouri, Buffalo, New York, and Cincinnati, Ohio, which were established in the census year. By duplicating a large share of the special news supply of each to the other papers the publishers are able to largely reduce expenses. Several of the penny papers of the Scripps Company have attained large circulations.

e The prevailing price for a single copy of a daily paper in the territories and also in the Pacific states is 10 cents. The *Eureka* (Nevada) *Daily Leader* sells for 25 cents a copy; the *Bodie* (California) *Daily Free Press* for 12½ cents a copy. The weekly edition of the *Bodie Daily Standard-News* costs 25 cents a copy. The *Daily Courier de San Francisco* (French) has a subscription price of \$24 a year; the weekly edition, \$10; the semi-monthly edition, \$6. The weekly edition is sold at 50 cents a copy. The subscription price of the *Helena* (Montana) *Daily Independent* is \$24 a year.

to create for itself a foothold. When they succeeded, success brought with it the ambition to enlarge the scope and the usefulness of the paper, and an increase in the price was the natural consequence. The tendency in American daily journalism is not toward the penny press, for the self-evident reason that all journals are so cheap that the poorer one, at a less price than the one very much better, cannot expect the patronage accorded them at the time when they entered a field occupied exclusively by high-priced journals, which were also ill adapted to popular reading.

Present tendencies as to price.

THE INFLUENCE OF THE PENNY PRESS.

But the American penny press has served other good purposes beside bringing down the average cost of the newspaper; and it was a natural consequence of the character of the men who generally founded them, and of the surrounding circumstances, that these papers were not identified with political organizations. Growing in strength, they maintained and fortified their independence. Up to the time of their appearance the daily press of the United States had been entirely a partisan press, all of the successful journals being warmly enlisted in the cause of one or the other of the existing parties, as they had been since the adoption of the federal Constitution. The penny newspaper subordinated politics from the start, because, in the first place, its founders were not politicians and had no political connections, and, in the second place, they expected to find their readers among the poorer classes of all political parties—the men and women who wanted to know what the news of the day was, and wanted to get it in as cheap a form as possible. It is an undoubted fact, as asserted by Frederick Hudson in his *History of American Journalism*, that when these new and dangerous engines of public opinion first made their appearance and began to be hawked through all the streets and by-ways of the great cities they met with the determined opposition of the professional politicians, who saw in them the leverage by which in time their firm grip upon the press of the country was to be unloosed. There was an interval of ten years, during which time, by the sheer force of its superior circulation, the penny press exerted the most powerful newspaper influence that was felt in the United States, and during this interval its beneficial influence was the most apparent. It taught the higher-priced papers that political connection was properly subordinated to the other and higher function of the public journal—the function of gathering and presenting the news as it is, without reference to its political or other effect upon friend or foe. The emancipation of the American press from the thralldom to party, under which it struggled for so many years—years in which its growth and usefulness seemed to stagnate—has not yet been accomplished to the degree that is desirable, but it has been fairly inaugurated, and even the avowedly partisan journals of the day which exert any considerable influence upon the public mind now regulate their loyalty to party by subordinating it to this higher function. For this great advance we are more indebted to the penny press than to any other cause.

The service of the penny press to journalism.

Independent journalism in the United States.

The advent of the penny press concluded the transition period in American journalism, and had three effects that are easily traceable: It increased the circulation, decreased the price of daily newspapers, and changed the character of the reading matter published. The most important of these effects was the cheapening of newspapers. The maximum price per copy of the daily papers in the smaller cities is now five cents, a figure which was settled upon during the civil war, when the cost of paper and the wages of labor went up enormously, followed by a universal increase in the subscription price of daily newspapers. With the exception thus occasioned the price of the larger dailies has been tending slightly downward, under the influence of the penny press, notwithstanding the fact that the character and cost of these journals have been constantly improving and increasing. Papers like the metropolitan dailies of to-day might undoubtedly be printed and sold at a profit for less money than is now received for them, but they are not likely to be, because of this constant irresistible tendency to an increase in the cost of producing them. Every year the ramifications of the news agencies become more extended, and the sums expended for editorial and reportorial service grow more generous. No metropolitan journal can long hold its own which permits its rivals to constantly and perceptibly excel it in the expenditure of money for the collection and presentation of news. The single item of telegraphic bills, which has been added to the cost of publishing a newspaper since the days of the blanket sheets and the founding of the first penny papers, has made a difference of quite one-sixth in the cost of publication of a representative paper, and in the meanwhile, and notably since the war, there has been a decrease in the cost of mechanical production.^(a)

Three results of penny papers.

Increased cost of publishing daily papers.

^a The penny press in England has developed to a degree and in directions unknown in the United States. Leaving newspapers out of the question, the weekly and monthly publications issued for a penny in London present one of the phenomena of the age, a great number of them attaining circulations almost fabulous. It is no exaggeration to say that between five and six millions of this class of publications are circulated in London alone every week. Many of these journals are of a semi-religious character, like the *Christian World*, published twice a week, with a very large circulation, and consequently in great favor with advertisers; *The Christian*, *The Christian Age*, *Christian Globe*, and *Christian Union*. Francis Hitchman states (*MacMillan's Magazine*, March, 1881) that eight of these semi-religious penny periodicals published in London enjoy between them an average circulation of between a million and a quarter and a million and a half copies a week. One of the evidences of their great circulation is the large number of costly advertisements they contain. Of the purely secular penny press of London, the most successful specimens are *The Family Herald*, founded in 1844; *The London Journal*, founded in 1846; *The London Reader*, founded in 1864, and *Bow Bells*; all of which closely resemble Robert Bonner's *New York Ledger* in contents and character, and are remarkably successful. Literature for boys is an important and not commendable feature of the London penny press, fifteen papers of this class being published in London every week, with a total circulation of a million and a half copies.

THE TENDENCY TO INCREASED EXPENSE IN DAILY NEWSPAPERS.

On this point of the comparative cost of printing and publishing a newspaper in accordance with the modern expectations some valuable data are given in an address delivered by Whitelaw Reid, of the *New York Tribune*, in 1879. Mr. Reid directs attention, first, to the greater cheapness with which printing paper is supplied, to the reduced telegraphic rates, to the more perfect machinery, dispensing with the services of many men, and to the larger profits from increased circulation and the corresponding increase in the value and cost of advertising, as causes which naturally tend, under the constant pressure of strong competition, to force down the price of newspapers to a point still cheaper than at present, the present price not being so cheap, on the average, as that which prevailed before the war, when paper cost more than now and machinery was far less perfect. On the other hand, there is to be considered, first of all, the constant tendency to increase in the amount of reading matter of all kinds daily expected and furnished, which drives journals into the constant publication of supplements, extras, double sheets, quadruple sheets, and for the sum of three or four pennies supplies the reader with an amount of reading matter equivalent to the contents of a thick book, costing one dollar or more, and collected and printed at a cost tenfold what the book's contents cost. In the second place, it is to be noted that the profits of newspapers do not increase in the same ratio as the circulation, especially in the case of those which devote large portions of their space to advertisements, which bring so much profit, and no more, whether the number of copies printed on a certain day is 10,000 more or 10,000 less than on a certain other day. In the third place, and it is the real consideration in the case, the actual increase in the cost of preparing the contents of a great newspaper of this day renders a reduction in the price at which they are furnished to subscribers out of the question. In illustration of this fact, Mr. Reid supplies in juxtaposition the comparative cost of publishing the *New York Tribune* in 1859 and in 1879. In 1859 the total outlay for news, editing, type-setting, printing, and publishing, including the accounts of the editorial department, composing-room, press-room, publishers' department, correspondence, and telegraph, was \$130,198. In 1879 the outlay of the year in the same departments was \$377,510, or nearly three times greater. Comparing the years 1859 and 1874, Mr. Reid indicated the division of this increase between the several departments of the paper as follows: Telegraphic expenses of 1859, \$11,679; of 1874, \$51,728 88; composing-room bills of 1859, \$42,256; of 1874, \$125,883 28. The total expenses of the editorial department in 1859 were \$43,125, including correspondence; in 1874 these same expenses had increased to \$188,829 45. In reply to an anticipated criticism that this exhibit is deceptive, because receipts have increased proportionately with expenses, Mr. Reid continues:

To this criticism the balance-sheet affords the answer. On a business of half a million in 1859, as a two-cent paper, the *Tribune* made a net profit of \$86,000. At the beginning of 1879 we found that on a business of nearly three-quarters of a million, as a four-cent paper, it had made \$85,588. The fluctuations in the interval had been at least sufficient to show that in a matter of such magnitude it was not wise to hunt for any more risks than we already had. In times of great excitement, presidential years and the like, the volume of business of course runs up. I have myself been able to report a net profit of \$155,000 on a business of \$974,000, and on the smaller business of \$941,000 a profit of \$171,049; and I have also had to report on a business of \$925,465 a net loss of \$96,690. Or, to rid the statement of figures, we have made \$85,000 as a two-cent paper; have spent a half more, and made only the same sum as a four-cent paper. In the interval we have sometimes spent twice as much to make only twice as much, while at other times on a like expenditure we lost as much.

The *New York Sun* in 1876 published a detailed statement of the current expenses of its publication, which confirms and illustrates the conclusions reached by Mr. Reid. The number of persons then employed in that office as 249. The expenses of the establishment for the week ending March 11, 1876, were \$15,817 17, the items of which were as follows: Editorial expenses, including salaries, telegrams, etc., \$3,826 83; publication salaries, \$429 51; mail-room, \$197; composition, \$1,486 91; stereotyping, \$296; press-room salaries, \$940 47; press-room expenses and supplies, \$100; ink, \$138 72; paper, \$7,074 55; coal and gas, \$176 50; steam-power, \$70; postage, \$330 68; general expenses, \$750. Dividing this amount by seven, it gives a daily average of \$2,259 59 as the outlay incurred for the direct benefit of every person purchasing the paper, who secures the results of it all for two cents.

PRICES AND CHARACTERISTICS OF WEEKLY PAPERS.

The price at which weekly papers are furnished in the United States has varied very little since the days of the colonial press. The early rates established were low enough to prevent their proprietors from growing rich, and they have been kept low enough since to accomplish the same purpose. The standard price for an average weekly newspaper may be said to be \$2, although the average for this class of journals will be found to be slightly lower. (a) The country weeklies suffer severely from the competition of the weekly editions of the daily papers. The latter, made up from the type which is set from day

^a There is no such uniformity in the price of the weekly provincial press of England as in that of the United States. Like the English dailies, they are generally sold at a certain price per copy, instead of at an annual subscription price, this price varying from 4d. (and at rare intervals 5d.) to 3½d., 3d., 2d., and 1d., with an occasional half-penny sheet. Taking 2d. as a fair average price, their annual cost would be \$2 08 per annum, or slightly above the average for the United States (\$1 75). Of late years the steady tendency of the weekly English press has been toward a lower price per copy.

to day for the daily edition and selected and condensed throughout the week, involve an additional expense upon the publishers of but little more than the cost of the white paper used and the press-work and ink. They are therefore able to furnish them at a comparatively greater profit than that which can be obtained by the country newspaper proprietor, who must set and pay for all the matter he prints in his one weekly edition. The publisher of the weekly edition of the daily paper can also furnish his readers with a much larger and more varied supply of reading matter at a figure that enables him to make money, while his rural competitor, if he furnished the same amount, would find it necessary to speedily suspend. These weekly editions of the daily papers are frequently supplied at the rate of \$1 50 per annum, and in some cases as low as \$1 a year, and they naturally attain to large and widely diffused circulations. There are several of these editions which circulate thousands of copies in excess of the daily editions and penetrate into nearly all the states of the Union. These papers can be sold at a price but little in excess of the actual cost of the white paper used upon them, the proprietors relying for ample profit upon the money obtained for advertisements inserted therein. Under the increasing competition thus engendered the price of the country weeklies has a tendency to decline, while their character does not, as a rule, improve in the same degree that has been noted in the daily newspapers of the United States.

Weekly editions of daily newspapers.

Closer competition in weekly journalism.

CAUSES OF THE OVERDEVELOPMENT OF THE WEEKLY PRESS.

The local newspaper as it is frequently seen in the United States presents the most primitive aspect of journalism. Following fast on the heels of the railroad into the heart of the wilderness, with a sublime faith in the conquering power of printers' ink which challenges admiration, it welcomes fields of industry not more promising or less painful than those which found the fathers of American journalism ready to bear and to suffer all things. Hundreds of newspapers report to the census a circulation of 500 or under, at from \$1 50 to \$2 each, and an advertising patronage in proportion. They are hardly to be reckoned among the tangible evidences of wealth, springing up in a night-time, and being liable to disappear as quickly. During the brief period of this investigation some newspapers which existed when it began had ceased to exist before its conclusion. They are frequently established by men of a migratory disposition, who sound a town, and, after a few months of unsuccessful endeavor, pack their types and press and appear with a new name and a cheerful flourish in some other locality equally unpromising. (a) They are the *ignis fatuus* of the press, and elude the most careful attempt to give them a local habitation and a name in census reports. This migratory tendency is especially noticeable in the frontier towns of the West, and the territories naturally present more instances of this tendency than any single state. Yet it is a fact worthy of record that the oldest settled communities, which in other respects offer few signs of variation from one census to another, are subject to this spasmodic journalism. New papers are constantly appearing in the little towns of New England and the middle states, and as constantly disappearing. Sometimes they live, and after a hard struggle, and by virtue of the most pinching economy, become an element of value in the community and a source of meager livelihood to a proprietor who is willing to be man of all work. Three causes tempt to such ventures. First among the causes is to be reckoned politics, every new political movement hatching its brood of papers. The most recent illustration is afforded by the greenback party, upward of a thousand papers being established throughout the country to advocate the principles of that party, more than half of which died before they could establish a foothold in this report, being born of a temporary flurry and dying with its subsidence. The extent to which journalism is dependent upon politics in this country may be judged from the fact that the decadence of the greenback movement carried down a large proportion of its press organs. If it had flourished longer, their lives would have been longer; if it had become one of the great and permanent controlling forces in this country, a large proportion of its press would have likewise become a permanent force. From the revolution down newspapers have flourished or languished according to the same rule.

Causes of overdevelopment.

The political cause.

A second cause of this overdevelopment is the prevalent belief that newspaper publishing is an easy method of making a livelihood, and the resultant disposition of men unfitted by training and qualification to enter it. A large portion of the class of newspapers we are now considering is owned and managed by men whose sole education has been picked up at the case as apprentices or journeymen printers, and who bring to their calling only this mechanical training. Some of the schedules returned from newspaper offices in response to the inquiries of the special agent reveal a degree of ignorance over the publisher's own signature which must largely affect the character and influence of the paper whose columns are thus presided over. The comparative cheapness of the materials necessary to start a newspaper, and the fact that in this class of journals the mechanical training is indispensable, has led to the establishment of many papers which cultivate barren fields with dull instruments. An ambition altogether laudable is behind these enterprises, and the early history of the press in all parts of the country is filled with instances of beginnings equally humble

Lack of educational requirement.

^a Samuel Pike, who established the *Peru Forester* at Peru, Indiana, is said to have established more newspapers than any other man in the United States.

and unpropitious. The contrast between the great metropolitan journals of to-day, with their large and trained staffs, their wonderful mechanical facilities, their immense resources, and these struggling, starving, ragged-edged sheets offers the most inspiring point of view from which to estimate the achievements and the possibilities of the American newspaper press. The United States shows the primitive and the fully-developed journalism in closest juxtaposition, and in the humbler and the narrower field the work done and the influence exercised are often worthy to be ranked with those of other more fortunate exponents of a powerful and potent press.

A third cause of the prolific appearance of the local newspaper is the influence of the device known as co-operative publication.

THE CO-OPERATIVE PAPERS.

The constant tendency in daily newspapers, especially in the large cities, to an increase in regular expenditures is a conspicuous feature of American journalism, which is offset, on the other hand, by the many contrivances for cheapening the publication of weekly newspapers, and thus rapidly multiplying their number, that of the co-operative printing companies being the most noticeable. This has grown to be so striking a feature of our newspaper press that it has seemed wise to gather a special line of statistics relating to it.

In the return made to the Census Office on the special schedule sent them twenty-one of these establishments reported that 3,238 periodicals were supplied with half-printed sheets (3,089 weeklies and 149 of other periods of issue, including 32 daily papers), employing in their manufacture 533 males and 29 females, and paying out annually in wages \$286,147, an average of \$13,626 to each establishment. These establishments reported the value of their annual product at \$1,037,929, an average of \$49,425 to each, and an aggregate of 2,976,000 ems of type set to each half sheet printed, an average of 141,714 ems. In their work they used 175,127 pounds of type, an average of 8,339 pounds to each establishment, and 64 presses, all of which were driven by steam. Eight of these establishments printed their half sheets from stereotyped plates, and thirteen printed directly from the type.

The business of printing co-operative sheets is simply the supplying to a variety of papers in different localities of a half-printed sheet to the number of their respective circulations, leaving to the home office the labor and expense of setting the type and doing the press-work of the other half. It has been estimated that the sum of \$2,000,000 annually is saved to the publishers by this contrivance.

These co-operative papers are known among the printers as "patent insides" or "outsides", as the case may be. The establishments furnishing them buy their paper in large quantities, at prices which enable them to sell it again to the local offices, half printed, at a figure but little above what the cost of the white paper would be to the latter. The reading matter furnished on the half sheets being the same to all the offices supplied, the cost of type-setting is comparatively small. The size of these sheets varies, some of the larger houses printing half a dozen different sizes of folio and quarto sheets, to fit as many different presses. The chief profit to the co-operative printing-houses arises from the privilege of inserting a certain quantity of advertisements in the reading matter, for which they make contracts at advantageous rates, on the ground that the large number of copies printed for all the papers supplied makes it the cheapest kind of advertising.

The publisher who adopts the co-operative form surrenders all control over one-half of his paper. It being obvious that no one would do this who can make an advantageous use of that half by controlling it for his own business, it follows that the co-operative papers are invariably located in the small towns, or are the weaker competitors in the larger ones, and that their average circulation is limited. The figures given in the text are supplied by the co-operative establishments themselves, are printed just as supplied, and show an average circulation for these papers of 608 copies, which is considerably smaller than the average for the country. It does not speak well for the general prosperity of weekly journalism in the United States to find that no less than 3,238 of these papers use either the patent inside or the patent outside, their aggregate circulation being given at 2,066,922, which is over a million and a half copies per week less than that of the weekly papers—804 in number—connected with the daily press of the United States.

Another fact brought out by this special inquiry is that the twenty-one co-operative printing firms, with a single exception, reported that there had been an increase in the number of newspapers supplied with half sheets in the census year over any previous year, the highest increase being 90 per cent., by an establishment which supplied 75 papers in the census year, and the lowest 5 per cent., by an establishment which supplied 425 papers weekly with 304,920 half-printed sheets.

A noticeable fact regarding these co-operative sheets is that no less than 70 per cent. of them are supplied to papers published in the western states, and all the percentage of increase in the census year was in the West, the states in which the largest number was supplied being Illinois, Iowa, Ohio, and New York. An examination of the papers themselves reveals the further fact that they are nearly all of comparatively recent date of establishment.

It is fair to infer, therefore, that this device for facilitating and cheapening the publication of newspapers has been an extremely important factor in the abnormal development of this class of journals. The first establishment of this kind of which I have been able to get any clew appeared in Milwaukee in 1864, and it was followed the next year by one in Chicago. The remaining establishments were all organized between 1870 and 1880, and the impetus they have contributed must be held in large part responsible for the remarkable increase in the number of newspapers between the two censuses of those years.

Origin of the system.

Another somewhat similar device for cheapening the cost of printing the local newspaper was found to have come into much more general use than is supposed—that of printing one paper for two or more contiguous towns with a change of name and a substitution of several columns of local news of one town for that of the other in the different editions; and in this way one establishment frequently ekes out an income sufficient to maintain itself by drawing tribute from several small towns. There are some cases where as many as half a dozen of these local papers are furnished from one printing press, all of them alike except in the feature indicated. This method of publishing local sheets is quite as prevalent in the East as in the West, one instance being discovered where an office in Providence, Rhode Island, supplied the papers for towns located in three different states. Of the 279 local weeklies published in Massachusetts, 25 were not printed in the towns where they were published. Medway had two weekly newspapers, both of them printed elsewhere.

Combination newspapers.

Both of these methods of cheapening the cost of printing newspapers may be said to be of English origin, although the co-operative system has never developed there quite in the manner or to anything like the extent that it has in the United States. In London there are a number of establishments which carry on a large business of a kind practically unknown here. These establishments are known as “The Central Press,” “The Central News,” “The Provincial News Supply Association,” “The London Associated Reporters,” and so on. The first of them in date of origin is the Central Press, founded in 1863. This establishment early took advantage of the art of stereotyping by means of *papier maché* molds, and by this method produces as many stereotype copies of the matter prepared in its office as it can find customers for among the provincial newspapers. It employs a literary staff for the preparation of its news and miscellaneous reading matter, and possesses all the mechanical resources for preparing it directly for the press. By the middle of each day from ten to twelve columns of newspaper reading matter are written, selected, or condensed from the London morning papers, set in type, corrected, and stereotyped, and sent by the evening trains to customers in the provinces. The matter thus produced is made up to suit the requirements of the purchasers, and consists of one or more leading articles, a summary of the morning news, a column giving “the spirit of the press,” a monetary article, a London letter, and occasionally book reviews, etc., and appears the next morning in half a dozen or more provincial papers, located in Newcastle, Plymouth, Hull, Manchester, etc.

English origin of these devices.

The London co-operative houses.

This system of co-operation in the publishing of daily newspapers is thus far without any considerable imitation on this side of the water, and is not likely to have any, in this generation at least, owing to the greater distances which separate the daily newspaper towns. These London agencies also prepare in the same manner columns of news in stereotype for the weekly country journals, and this practice has developed into the supply of printed half sheets as it exists in this country. Mr. William Eglington, of Bartholomew Close, is credited with having originated this plan of partially printed sheets.

There are several similar establishments in the provincial cities of England, which do a large and profitable business, the principal of these being that of Tillotson & Sons, of Bolton, in Lancashire. This firm started the Bolton *Evening News* thirteen years ago at a half-penny, the first newspaper of the kind published in the United Kingdom; and to it must also be assigned the credit of originating the system of publishing several newspapers from the same types and press, of which mention has been made above regarding its success in the United States. Their combination newspaper is known as the Bolton *Weekly Journal* series, and is a set of half a dozen reprints of the same paper adapted to different localities within a small radius. (a)

While very few of the co-operative papers are in any sense a credit to the press of the country, it may be said of them that they are better for their localities than none at all, and that the co-operative features are the swaddling-clothes which healthy newspapers will in time outgrow, none of them preserving the patent outsiders after they reach a point where they are able to do their own printing. It is notorious that among the weekly newspaper publishers which do not use the co-operative sheet there is a bitter feeling against it and a constant effort to dissuade from its use. They find them to be not only discreditable to the craft, but as having a tendency to create competition by cheapening publication in towns and villages where there is not legitimate room for such an increase. From this point of view the system has undoubtedly been vicious, enabling printers to run a newspaper as a mere adjunct for a small printing office, all the stock in which can be supplied for \$500 or less. And they make a showing which is quite as discreditable from a literary

Character of the co-operative papers.

a Mr. W. E. Baxter, of Lewes, proprietor of the *Sussex Agricultural Press*, was in 1872 the proprietor of no less than twenty-four of these papers, published in several counties, but all printed, wholly or in part, in Lewes.—Grant.

as from a mechanical point of view. While the co-operative papers number 3,238 in a total for the entire country of nearly 12,000, they do not represent one twenty-fifth of the earnings, and even less of the circulation; and it is therefore proper to set them altogether aside in any estimate of the real worth and character of the American press. They are a fashion of the day, and are due quite as much to the excessive advertising of the country as to anything else.

To these causes may be attributed the continued failure of the weekly press of the United States to equal in character the same press of Great Britain. That it does not equal it will hardly be questioned by any one familiar with the average of these papers in the two countries. There is now in progress in England a perceptible decadence of the old-fashioned, high-priced, and ponderous weekly provincial newspaper which attained such power and prestige in the last half-century. It was published on the market day in the shire-town, and served its readers for a week, supplying them with a *résumé* of all the news of the previous seven days, and discussing the politics and diplomacy of the continent with considerable force and influence. The field of this peculiar type of journal has been largely circumscribed in England by the increasing facilities for bringing the daily papers of the provincial towns within easy reach of all parts of Great Britain. One of the most prosperous of these typical journals is the *Hereford Times and General Advertiser*, now in its forty-ninth year, the proprietors of which boast, not without reason, that "it is the largest newspaper published in the world". It is printed on two full sheets, covers sixteen pages of seven columns each, and is not unfrequently extended by gratuitous supplements from 112 to 126 columns per week. The paper has a large circulation, and, being published at the comparatively high price of 3½d., is one of those papers which pass from hand to hand and from family to family throughout the whole of the extensive agricultural region of which Hereford is the center. Its advertisements are also a source of great profit. The circulation of papers of this type is fast becoming more limited, and their proprietors are often recognizing the fact by supplementing them with daily issues. Precisely such a paper as the *Hereford Times and General Advertiser* has never appeared in the United States, nor does it seem likely that it ever will, if indeed it continues in England.

Notwithstanding the disadvantages under which the weekly local newspaper labors in the United States, it has a firm hold upon the public esteem—a hold which certainly increases from year to year. The weekly edition of the metropolitan daily contains none of the local intelligence, so widely sought for everywhere, and the rurally-printed papers therefore make it a rule to devote the larger portion of their energies to the gathering of vicinity news, thus frequently attaining large circulations, even in localities that are promptly reached by the daily papers from neighboring cities. Their price is invariably lower than that which the same class of paper is able to command in the rural towns of Great Britain. As a rule, they are not as well printed as the English weekly journals, although there are some conspicuous exceptions.

The cost of the semi-weekly and tri-weekly papers of the United States varies more widely than that of the weeklies, the semi-weekly ranging in price from \$2 50 to \$4 per annum, and the tri-weekly from \$3 to \$5. For reasons indicated elsewhere in this report, neither class of papers is increasing in number or reaches a large average circulation.

CONDITIONS GOVERNING THE VALUE OF NEWSPAPER PROPERTY.

The conditions determining the value of newspaper property in the United States have already been hinted at in the discussion of the circumstances under which they are born, to live or to die. They have undergone a complete transformation since the colonial and post-revolutionary eras, and now widely differ in different localities and differing circumstances. It cannot be said that the newspaper field presents the same inducements for the investment of capital and brains as are offered by the generality of businesses in this country, immense sums of money having been frequently sunk in the attempt to establish journals which never paid expenses. Whether such investments are to ultimately prove profitable or not depends in a larger degree than ordinary upon the intelligence and tact displayed in the management of the establishment. The field for a new newspaper enterprise can often be created where no room for it seemed to exist by the superior enterprise and capacity of those engaged in it; but it is a fact, which long and frequent experience has demonstrated, that even under the most favorable circumstances, in communities where existing journals have the field, the establishment of a new daily newspaper is an undertaking requiring an outlay of money which will continue to be larger than the receipts for a period more or less indefinite. There are several cases among the daily journals reported in this census where large sums of money have been regularly sunk for many years in the unsuccessful effort to secure a remunerative hold upon public favor. In the large cities the inauguration of new newspaper enterprises is of such hazardous and doubtful success that these unsuccessful attempts are frequently carried along from year to year at annual loss, because suspension involves the loss of all the money already expended, while the existing nucleus, with its franchises and good-will, under more favorable circumstances, may some time be made a valuable property. It follows that what is known as the "good-will" of a newspaper establishment is a real and substantial capitalization, and that the value of successful newspaper property is immensely greater than the actual cost of supplying and maintaining the plant, and cannot even be accurately measured by the amount of dividends paid on the investment. Where newspaper property is capitalized for the formation of stock companies, as is now a common practice, due regard is paid to this value of an established

The American weekly press compared with the English.

Value of the weekly press.

The investment of capital in newspapers.

good-will. The newspaper which is once successful in reaching a paying basis is not easily disturbed, and it may be said of it, as it may be said of any other undertaking, that ordinary business discretion and editorial intelligence will render it permanently valuable, just as the continued lack of these things will inevitably in the end work its ruin.

THE PERSONAL AND POLITICAL ELEMENTS.

I am led to dwell on this point in view of the prevalent belief that there are personal and political elements which enter largely into the conditions of newspaper stability and must be considered in a reckoning of values. The case of Horace Greeley, whose individual personality had so much to do with the building up of the New York *Tribune*, is often cited as an illustration to this end. There have been numerous other instances of a similar character in the journalistic history of the United States, and among them may be enumerated Frank P. Blair, of the Washington *Globe*; Gales & Seaton, of the *National Intelligencer*; Henry J. Raymond, of the New York *Times*; James Gordon Bennett, of the New York *Herald*; and Samuel Bowles, of the Springfield *Republican*. The list might almost be extended to include the whole category of the early successful editors of the country, but the further we carry the illustrations the more convincing becomes the evidence that the personality of no one man is essential to the permanent success of newspaper enterprise. It is not to be denied that the personal element frequently adds to the popularity of such enterprises, as it is sometimes the chief explanation of their successful establishment in the beginning; but there is positively no case of a well managed newspaper declining in business success solely or chiefly because of the death or withdrawal of the man to whose personality or political writings it owed its original success. In testimony of this fact, the tendency in American journalism is more and more toward the impersonal editorial work. The great bulk of the editorial writing on all successful journals has long been done by clever and educated men, whose names are unknown to the readers, but whose services are none the less valuable on that account. So long as it is possible to hire the best brains for the conduct of a newspaper its cash value as a business enterprise can be maintained, because its intrinsic value as a public newspaper can also be maintained.

Personal and political elements of newspaper stability.

The tendency toward impersonal journalism.

Neither is the political connection essential to the value of the newspaper. In the smaller cities it is an important element, on account of the official patronage it naturally brings with it. We have seen that the early history of the American press is mainly the record of the establishment of newspaper organs for the several political parties, and this fact has led to the belief that success is dependent upon such a connection. The Washington newspapers, which were universally recognized as the personal organs of successive administrations, were cases of this kind, but their ultimate failure and disappearance were not so much due to the loss of executive patronage and favor as to the gradual loss of prestige through the springing up of journals as good or better in other parts of the country. It is not to be denied that many readers subscribe for a particular newspaper on account of its opinions; and it may be set down for a fundamental condition of newspaper success that its editorial management must be able to keep it in line with public opinion in some one of its marked developments if its income is to be maintained unimpaired. The journal whose management is able to do that is able to survive the fall of political parties and to outlive successive organizations whose interests it champions as they pass. The neutral paper will rarely, if ever, succeed in this country on any extended basis, but the independent journal is the one which, on the whole, presents in nearly every large city of the United States to-day the most conspicuous illustration of journalistic success. The explanation is simple: it is patronized not so much for its opinions as for its news, and in almost every instance its success may be ascribed directly to its superior enterprise in the collection and presentation of the news. Frequently it has been claimed otherwise, and the success of the independent journal in the United States has been instanced to prove that the larger portion of the average newspaper-reading community prefers a journal which is professedly not in alliance with any political party. But such a constituency is necessarily a meager one in every locality, however superior it may be in average intelligence. On the other hand, the constituency which will subscribe for the best and most enterprising journal, without reference to its political expressions, is limited only by the reading capacity of a community, as has been shown wherever the experiment has been fairly tried; and it is this fact which promises for American journalism its most important and valuable development in the future.

Value of the political connection.

The independent newspaper of to-day.

If these conclusions regarding the unimportance of the personal and political elements in the success of newspaper enterprises are correct, they eliminate from the conditions of newspaper success the two main causes which are supposed to make these conditions different from those governing in any and all other business enterprises. The man who manufactures the best goods, and who maintains from year to year the same standard, or a better one, suffers from competition only when his rivals equal or surpass the quality of his goods; and it is precisely so in journalism. The chief difference between this business and any other, in considering the conditions of success, resides in the circumstances which surround the original establishment of a newspaper. To these it is necessary to briefly recur. Few of the valuable newspaper properties in the United States are yet half a century old; still fewer newspapers have lived to be a century old, and more of them die than live. These are striking and conspicuous facts, but they

Conditions governing the successful establishment of daily newspapers.

are facts not more patent in the history of newspapers than of any other kind of business, and in reference to journalism have simply been more a matter of record and public notoriety. Notwithstanding the element of precariousness which, it must be admitted, enters very largely into newspaper establishments, the business is becoming more and more permanent in its character, and it may safely be assumed of most of our existing great daily journals that they have come to stay. Each year that passes renders them more invincible to the competition of new rivals, for it fortifies their hold upon an established and increasing constituency, renders more tangible what is known as their good-will, and continually crowds to the wall the weaker rivals. In striking testimony are such facts as these: In Boston, in 1846, there were fourteen daily papers published; now there are but eleven, and these eleven have a circulation five times greater than that of the fourteen papers of 1846. In 1840 eighteen daily papers were published in New York city, with an aggregate circulation of 60,000, and in the interval 110 new papers have been established; to-day there are but twenty-nine in existence there, but they enjoy an aggregate circulation of 765,743. In 1847, when the population of New Orleans was about 116,000, there were nine daily papers printed in that city; in 1870, when the population was 191,418, there were but five daily papers printed there; and in 1880, when the population had reached 216,090, there were ten daily papers, or one more than in 1847, and the aggregate of daily circulation had more than doubled. The history of daily journalism in nearly every large American city is a repetition of this record.

The cost of publishing a modern newspaper is constantly on the increase, and involves an outlay which can only be returned by large business. Thus the advantage of those which occupy the field continually becomes more secure. The temptation to invest the requisite amount of capital in a newspaper enterprise, which must crowd its way with slow and difficult steps against well-fortified opposition, is not the same as that which leads continually to like investments in ordinary business ventures, because the advance toward success cannot be made by gradual steps on a scale of expenditure proportionate to the ratio of income. To succeed, such an enterprise must at once present itself as the equal, if not the superior, of those it finds occupying the field, and must continue to hold its own in this respect until it has thoroughly convinced the constituency that slowly gathers around it of its permanent excellence, all the time submitting to a daily outgo largely in excess of the income. Capital is further deterred by the fact that even under these circumstances, where the ability to wait for pecuniary return is abundant, the experiment may in the end prove a failure and the capital sunk in the foundations be irretrievably lost.

THE ORIGIN AND VALUE OF GREAT NEWSPAPERS.

It is to be observed of most of the existing large newspaper establishments that they were not the outcome of the investment of capital, but sprang from small and obscure beginnings, after long reverses, attaining their present strength, influence, and value as the result of brains and energy rather than of money, and are legacies to this generation of the transitional era in American journalism, coming into successful being under the operation of circumstances which have disappeared in the modified conditions of a journalistic era no longer transitional. The New York *Herald*, *Sun*, and *Tribune*, and the Boston *Herald* are striking illustrations of this fact, while the New York *Times* and the Philadelphia *Times* are perhaps the most conspicuous instances to be found of the success of newspaper ventures which began with ample pecuniary support. The New York *Times* was conceived at a most fortunate moment, just as the transitional journalistic era had closed. It started under auspices which gave it immediate prestige, and none of the daily journals established in the metropolis since have been able to achieve a similar feat. The most noticeable later instance of the successful investment of large capital for the establishment of a daily newspaper is the case of the New York *Graphic*, whose projectors discovered a unique and attractive field for daily journalism, and may attribute the success of their enterprise to that fact. Since the year 1833 there have been no less than 146 (a) different daily

The New York *Gazetteer* for 1860 contains the names of 771 newspapers and journals, of all classes and periods of issue, which have been established and disappeared in the city of New York subsequent to the revolution and up to the year 1860. In that year 250 newspapers and periodicals were published in New York city. There were 582 in 1880. It is altogether probable that since 1860 the number of newspapers and periodicals established and suspended in New York city has doubled upon the number reported in 1860. The *Journal of Commerce*, established by Arthur Tappan in 1827, is the only survivor of the morning newspapers in existence in New York at that time. The New York *Evening Post* and New York *Commercial Advertiser* are the only surviving evening newspapers which have a date of establishment equally remote.

either one of them a successful competitor for the places now occupied by existing journals, only four of which were started previous to 1833; but the chance of occupying one of those places grows less with the increasing wealth of existing dailies and the increasing cost of publication, and capital is less and less inclined to seek it.

The newspaper properties which were thus built up out of nothing, as it were, are variously estimated in value according to their surroundings, and these values are liable to fluctuate at times to a marked degree. Immense

The pecuniary value of existing newspaper properties.

fortunes have been made as well as lost in newspaper enterprises in this country, and there are a number of well-authenticated instances of the private or public sale of newspaper property which indicate the estimates publicly put upon their value where all the conditions are healthy.

The *Morning Call*, of San Francisco, at a private sale some years ago, brought \$100,000, and the Cincinnati *Times* was sold at auction in 1870, on the death of its proprietor, for \$138,550, for the purpose of

Noted sales of newspaper property.

consolidating it with a new competitor, the *Chronicle*, established in 1868, with a capital of \$150,000. The *Times* had been established in 1841 by Calvin W. Starbuck and two other

practical printers on a borrowed capital of \$200. His associates were soon discouraged, but

Mr. Starbuck continued the undertaking, gradually making the *Times* one of the greatest journalistic successes of the West. Shortly before his death Mr. Starbuck refused an offer of \$225,000 from the parties who subsequently purchased the property at auction for \$138,550. The history of this particular paper still further illustrates the peculiar conditions surrounding the value of newspaper property. In 1871 it met with damaging competition from the *Star*, and after nine years these two journals were consolidated. Here, then, is the evidence that the value of newspaper property is not always what it is thought to be, or rather, perhaps, that it can be depreciated by determined opposition.

In a statement of its financial history, published on the thirtieth anniversary of its establishment, April 10, 1871, the New York *Tribune* said that the total cost of its production during the first week of its existence was \$525, and that it had then reached an average cost of \$20,000 per week, with a constant tendency to increase. When this journal was turned into a stock concern its shares were placed at \$1,000 each, and sales were made at \$3,500 per share. At present the shares of this journal, like those of the New York *Times*, organized on a like basis, are not in the market at any price. The New York *Sun* was sold in 1849 for \$250,000, while yet a penny paper, and "very cheap". (a) Either on the basis of the dividends regularly paid or the intrinsic value of several newspaper properties in New York their market price, if they were now, through any cause, to reach the market, would be among the millions.

The sale at public auction of the Saint Louis *Democrat* in 1872 gave another indication of the market value of newspaper property, it being disposed of to one of the former proprietors for the sum of \$456,000. Commenting upon this sale, one of the Saint Louis journals remarked at the time :

This is the first direct public sale of a large and well-established newspaper that has taken place in this country for many years, and the price paid affords some indication of the cash value of such a journal. It has been held a difficult matter to accurately estimate the worth of such an institution, on account of the varied properties that make it up. The actual material in the *Democrat* establishment would be valued at a comparatively small proportion of the price paid for the journal, but this material comprises only a small proportion of the real value of the establishment. The attributes of age, of established character, political views, advertising patronage, public influence, and subscription list, all grouped usually under the head of "good-will", constitute the substantial elements of value in an established journal. They are of a moral nature, and to a certain extent indestructible.

That these large values assigned to certain newspaper properties are not fictitious is well determined by the incomes they are known to yield to their proprietors.

THE DEVELOPMENT OF PRINTING PRESSES AND APPARATUS.

The advent of the third era in the history of American journalism was due, as has been seen, to certain changed conditions in the publication of newspapers, which were of somewhat gradual development, and had reached what seemed to be full fruition at the time when this census of the press was taken. The commencement of this era may be dated from the establishment of the first penny paper, in 1833, and with it the cheapening of newspapers to a point

Fast printing necessary to cheap newspapers.

that brought them within the reach of all classes of society, and correspondingly increased their circulation. But the cheapening of newspapers was only made possible by the invention of machinery which permitted of rapid multiplication, which was the condition-precendent to large sales at a low price. (b)

a Horace Greeley before the English parliamentary committee.

b In considering the development of journalism during the past thirty years there is one cause of its prosperity and increase which is often overlooked. The cultivation of the peculiar kind of talent required for the best newspaper work, the general recognition of the calling of an editor as a liberal and responsible profession, the increase in popular culture, and the consequent demand for a better order of periodical literature—these influences upon the character of the press are fairly estimated. Everybody understands also what enormous changes have been made in the newspaper business by the invention of the telegraph and the improvements in the railway and postal service. But these things would have been of slight avail had not the ingenuity of inventors of printing machines kept pace with the increasing wants of the public and the publishers. With such mechanical facilities as even the best offices could command thirty years ago a great newspaper of the present style would have been impossible, we might almost say inconceivable. The fast printing press has done as much for journalism as the telegraph and the railroad.—John R. G. Hazzard, *The Wonders of the Press*. New York, 1878.

Up to the revolution the newspaper printing presses had all been built on one general plan—a flat platen, impressing against type arranged on a flat bed. (a) In the earlier forms of this press the necessary pressure was obtained with a screw, and fifty impressions an hour was about its maximum capacity. The substitution of a lever motion for the screw increased the capacity to about 250 per hour. This modification obtained its greatest perfection in the Washington press, which was patented in 1829 by Samuel Rust. The first great advance upon the primitive lever was made in 1810, when Frederick Koenig, of London, succeeded in substituting the revolving impression cylinder for the platen, and a thousand impressions per hour thereafter became easily obtainable. (b) This press was first set up in the London *Times* office. In the issue of that paper for November 29, 1814, Mr. Walter thus described it:

The first printing presses.

Koenig's revolving-cylinder press.

Our journal this day presents to the public the practical results of the greatest improvement connected with printing since the discovery of the art itself. A system of machinery, almost organic, has been devised and arranged, which, while it relieves the human frame of its most laborious efforts in printing, far exceeds all human powers in rapidity and dispatch. That the magnitude of the invention may be justly appreciated by its effects, we may inform the public that after the letters are placed by the compositors and inclosed in the "form", little more remains for man to do than to attend upon and watch this unconscious agent in its operations. The machine is then merely supplied with paper. Itself places the form, inks it, adjusts the paper to the newly-inked type, stamps the sheet, and gives it forth to the hands of the attendant, at the same time withdrawing the form for a fresh coat of ink, which itself again distributes, to meet the ensuing sheet now advancing for impression, and the whole of these complicated acts are performed with such velocity and simultaneousness of movement that 1,100 sheets are impressed in one hour.

In 1827 Cowper & Applegarth, of London, built a double-cylinder press for the London *Times*, which superseded Koenig's complicated and cumbrous machinery and printed 2,000 impressions per hour, and in 1833 they followed it with a four-cylinder, which could, under pressure, print 5,000 sheets per hour.

Up to 1835 all the papers in the United States were printed by hand-power, the double-cylinder presses then used by the daily journals being turned by crank-men, and their circulation was still so moderate that it was possible in this way to supply the demand without serious inconvenience. The New York *Sun*, which was founded in 1833, discovered, two years later, that it was impossible to work off the edition, for which there was then a ready demand, without the aid of steam. This paper, and in fact most of the daily journals of that day, was then using a Napier press, the product of an English inventor, who had proved especially successful in adapting his machine to newspaper work. He obtained English patents dated 1827 and 1830, and up to 1835-'36 they were used with success in American offices. In 1828 R. Hoe & Co., of New York, made two of the Napier presses, the first for the New York *Commercial Advertiser* and the second for the Philadelphia *Daily Chronicle*. These presses were not of sufficient speed to supply the demands of daily journalism, then rapidly developing, and inventors everywhere applied themselves to the task of devising a press which should accomplish three objects at once, namely: First, print with extraordinary rapidity; second, print both sides of a sheet at once, or a perfecting press; third, dispense with feeders, or supply the sheets to the press by machine instead of hand labor. The achievement of these three results has been in the nature of an evolution, one step growing naturally out of the other, by the extension of the principle of rotary action for the reciprocating movement of the primitive presses.

First use of steam in American newspaper printing.

Hoe's presses.

Three steps in the development of modern printing presses.

Long before these achievements had been secured rapid printing had been accomplished by Richard M. Hoe in his "lightning press", patented July 14, 1847. The essential feature of this press was a simple one, being the principle that columns of type can be securely held on the surface of a rapidly revolving cylinder by means of wedge-shaped column rules, with their thin edges toward the axis of rotation, themselves kept in place by projecting tongues sliding in rebated grooves cut in the cylinder, and the whole form firmly locked or screwed together in the usual way. With this revolving type cylinder, and from two to ten impression cylinders arranged around it, from ten to twenty thousand impressions can be struck off in an hour. One person is required at each impression cylinder to supply the sheets of paper, which are taken at the proper moment by grippers, and after being printed are conveyed out by tapes and piled in heaps by self-acting flyers. For each impression cylinder there are two inking-rollers, receiving their supply of ink from the distributing surface of the main cylinder, which rise and ink the form as it passes under them, then again fall to the distributing

The Hoe cylinder press.

a A few attempts were made in the United States during the last century to improve the common press. Benjamin Dearborn, publisher of the *New Hampshire Gazette*, about the time of the revolution invented what was called the wheel press, which possessed the new and desirable quality of impressing the whole side of a sheet at one pull of the lever, and this press was used for a time at Newburyport. A citizen of Connecticut also took out a patent for a power-press. But these efforts led to no general improvement.—*American Cyclopaedia of Printing*.

b My own first acquaintance with a printing office was in Rochester, New York, in the year 1823. There was no iron press known there at that time. That used was composed chiefly of two upright wooden posts, a cross-beam, and platen, the latter suspended from a screw, which was operated by a long iron bar inserted into a wooden handle. The types were inked by deer-skin balls, the skins being filled with sheep's wool and nailed to wooden handles. Iron presses began to get into general use in this country in 1825, 1826, and 1827, especially in the larger cities. As late as 1829 I saw the then large edition of the New York *Courier and Enquirer* in the process of printing on a single iron hand-press, with a roller-boy behind it for inking the types.—J. F. Babcock, before Connecticut Editorial Association, 1855.

surface. The speed of these machines is limited only by the ability of the feeders to supply the sheets. The four-cylinder press can be run at the rate of 10,000 impressions an hour, the six-cylinder at 15,000 an hour, the eight-cylinder at 20,000, and the ten-cylinder at 25,000 per hour. The largest cylinder press is a gigantic machine, standing 18 feet in height and 31 feet in length, and is the largest size to which the printing press has attained, for the perfecting presses, which came after, are much more compact in build and movement.

The first Hoe rotary press was erected in the Philadelphia *Ledger* office in 1847, and the machine came into general use in the offices of large journals by 1850. The first six-cylinder press was constructed for the New York *Tribune* in 1852, and the ten-cylinder press came into use shortly afterward. The lords of the privy council of England, in granting an extension to the patent of this press, characterized it as "one of the greatest steps ever made in the printing art".

NEWSPAPER STEREOTYPING.

Even at that time, however, the Hoe press was not sufficient for the growing demands of journalism without a duplication of type, which not only largely increased the cost, but involved a loss of valuable time. The limitation of press capacity compelling the newspapers of the largest circulation to go to press before their neighbors, they could not print the latest news or make early sales, nor could they extend their out-of-town

Newspaper stereotyping.

circulation. It was the effort to overcome this difficulty which led to the discovery of the process of newspaper stereotyping, which is now in vogue in many of the offices with great circulations. The recent introduction of the *papier maché* process in book stereotyping led to a

series of experiments, which reached a successful result about the same time in this country and in England, the London *Times* using a stereotype process which was the invention of two Swiss mechanics, and the New York *Tribune*, in 1861, utilizing an invention of Mr. Charles Craske, of that city. His process was successful from the first, and it came into use in American newspaper offices at the time when the outbreak of the war increased suddenly and enormously the demand for newspapers. By this process a newspaper was enabled to multiply its forms indefinitely and with great rapidity, and might therefore put in use as many rotary presses as its sales would warrant. The application of stereotyping to newspapers was important in another respect, as it overcame the main obstacle in the way of the successful manufacture of the perfecting press.

The census inquiry revealed the fact that in 1880 there were 45 daily journals in the United States printed from plates made by the process of rapid stereotyping. These were located in the following states: California, 2; Illinois, 6; Indiana, 1; Kentucky, 1; Maryland, 2; Massachusetts, 2; Michigan, 1; Missouri, 2; Minnesota, 1; New Jersey, 1; New York, 9; Ohio, 6; Pennsylvania, 10; Wisconsin, 1. The Louisville (Kentucky) *Courier-Journal* is printed from stereotype plates 30 by 48 inches, which are claimed to be the largest stereotype plates made in the world. The Boston *Herald* is printed upon four Bullock web-perfecting presses, each with a capacity of 15,000 an hour, which can be forced to 18,000, and it is claimed that in this office the quickest time in the world is made in the manufacture of stereotype plates, two perfect plates having been made in seven minutes from the time the forms were received by the stereotypers. (a)

Beside the daily journals which are stereotyped, a large proportion of the weekly and other periodicals having large circulations are printed from stereotype plates. This is true of most of the monthly magazines and of the literary weekly papers. The process of stereotyping is found to be profitable, both in respect to saving the wear and tear of type and in the saving of time in reaching the public with the paper, when the circulation attains 15,000 and upward. Thus in 1880 there were 52 daily journals the circulation of which was over 15,000, and 45 were then printing from stereotype plates, several of the latter reporting their circulation under 15,000 and over 10,000.

THE PERFECTING PRESS.

By the invention of Hoe's "lightning press" it became possible to supply the demand for papers of the largest circulation of that day within an hour or two after going to press; but still there were deficiencies even in this, which came in time to be especially annoying to the evening papers in large cities. It often happens that a demand for one, two, or ten thousand extras comes upon a newspaper in the afternoon without warning, in

^a The forms for the morning edition of the London *Standard* come down to the foundry at intervals, commencing at 12 o'clock, midnight, the last form, with the latest parliamentary and other important intelligence, being received in the foundry at 2.30 to 3 o'clock. The eight plates are all produced and handed to the press-room in thirty-three minutes. The *Evening Standard* is published in four separate editions, the number of plates that are required varying according to the news that is received. The whole *Morning Standard* is printed in one hour and fifty minutes, and the *Evening Standard*, second edition, in fifteen minutes, the third edition in thirty minutes, fourth edition in twenty minutes, and the special edition in forty-five minutes. To accomplish this the *Standard* uses eight machines, seven of which run at the rate of 14,000 an hour. There are also six machines in reserve in another building, and also a complete font of type, to guard against accidents by fire or otherwise. The steam-power used is a pair of 45 horse-power engines in each building, and likewise two 60 horse-power boilers of the multitubular type, for auxiliary machinery, in the bill-room, foundry, and for working the lifts and machinery in the engineer's shop, where all repairs are carried out. The amount of paper used during the year 1880 for the *Morning Standard* was 3,412 tons, equal to a length of 36,609 miles, and for the *Evening Standard* 865 tons, equal to a length of 13,377 miles, making a total of 4,277 tons of paper, or 49,986 miles—an average of over 13 tons, or 160 miles per day.—Joseph Hatton, in *Harper's Magazine*.

which case, the regular edition of the first side having been already printed, it is necessary to bring the form of that side back from the composing-room to the press, and meanwhile the public is kept waiting for its news. This delay at a time when moments are precious was largely overcome by the invention of the perfecting press. Where this machine is in use the entire paper is upon the press at one time, and, whatever the demand, it can be supplied to the last copy without confusion, loss of time, or the waste of a single sheet, at a varying speed of from 8,000 to 15,000 copies an hour. By the use of stereotype plates the number of forms can be multiplied to supply an indefinite number of perfecting presses, so that practically there is no limit to the number of copies of an issue which may now be supplied by a newspaper thus equipped within an almost incredible space of time after the first impression leaves the press.

The perfecting press.

With the perfecting press came the further rotary mechanism, by which the feeding of the paper was accomplished automatically and the services of a dozen or more pressmen dispensed with. This machine, which is called the web-perfecting press, on account of its printing from a web of paper, has two main cylinders, instead of one, both forms, now rendered comparatively light and manageable by means of stereotyping, being put upon the press at once. Instead of piles of sheets cut to a uniform size, a roll of paper several miles in length hangs in bearings above. The end of this roll being introduced into the press, the paper is drawn through it at the rate of 50,000 feet an hour, a speed which must be seen to be appreciated; is printed on both sides, cut into lengths by knife-bearing cylinders, and finally is laid down, fifteen thousand completed papers in an hour. Finally, by a last and crowning invention, a rotary folding-machine has been added to the press, by which the papers as they come, all cut, upon the tapes, are caught, folded, and delivered ready for the mailing.

Description of the web-perfecting press.

The honor of bringing the printing press into this state of perfection belongs almost wholly to American inventors. The first web-perfecting press ever built was the invention of Sir Rowland Hill, the well-known advocate of cheap postage in England. It was patented in 1835, but never came into practical use, partly owing to the inconvenience of the conical type employed upon it, but mainly because of the difficulty of disposing of the sheets as fast as they were printed. The idea at the bottom of the machine had, however, previously occurred to several American inventors, who were at work upon it, and it grew up out of steady adherence to the principle of press making which Mr. Hoe had first put to practical purpose, and which had been at the bottom of all previous improvements—the substitution of the rotary for the reciprocating action. Mr. Hoe's first perfecting press was built about 1857, but it required a much tougher and stronger paper than American journals could afford to use, and was therefore not a success. William H. Bullock, of Philadelphia, in 1861, succeeded in making a web-perfecting press which worked with better satisfaction than any that had thus far appeared. By subsequent improvements Mr. Bullock overcame one difficulty after another, until, by 1870, he had a press which could deliver from 8,000 to 10,000 completed papers an hour. The Walter press, constructed in the workshops of the London *Times*, is much like the Bullock in general construction and capacity. It is worthy of note in this connection that the first fast printing presses used in either England or France were the work of American inventors. In 1849 Mr. Hoe built a rotary press for the Paris daily journal, *La Patrie*. The first Hoe press in London was built some years later for Lloyd's *Weekly Newspaper*, and its success led the proprietor of the London *Times*, in 1857, after a series of disastrous experiments with a clumsy vertical rotary press, constructed by Augustus Applegarth, to order two ten-cylinder Hoe presses. Previous to this time the London *Times* had been duplicating everything in type, in order to be able to keep two presses running simultaneously. In 1875 six of Hoe's web-perfecting presses were ordered by the London *Standard* and eight by the London *Daily Telegraph*, and in other establishments, both in London and the provincial cities, American-built presses are now largely used and give the most complete satisfaction.

A result of American invention.

The Bullock press.

The Walter press.

The largest of these perfecting presses yet made, and believed to be the most perfect and rapid printing machine in the world, has been recently erected in the press-room of the *Missouri Republican*, of Saint Louis. This press has a capacity of 30,000 perfect papers per hour, printed, cut, folded, and pasted, ready for delivery, is known as the Hoe double web-perfecting press and folding-machine, and prints and folds two perfect papers at a single operation.

The final development of the web-perfecting press, which reached successful operation in the census year, is a machine that prints from the types instead of from stereotype plates, and which promises to be of incalculable service to that increasing class of daily papers which print an edition of from 7,000 to 15,000 papers—hardly large enough to warrant the additional cost of stereotyping, and yet so large that it is difficult to handle it with sufficient rapidity by the aid of the cylinder press. In general construction it is not unlike the type-revolving presses, the forms of type being locked in curved beds or "turtles". If the machine is for printing an eight-page paper, the four outside forms are placed on the large central type cylinder in a group, with their heads toward each other, and the inside forms are placed similarly, diametrically opposite to the outside forms. These forms occupy one-half of the circumference of the type cylinder, and the space between the groups is used as an ink-distributing surface, receiving the ink in the usual manner. The type cylinder

The type web-perfecting press.

is surrounded by and connects with the impression cylinders. The machine is equipped with four or eight impression cylinders, according as one or two rolls of paper are used, double the capacity being obtained by the use of double rolls, and its capacity is from 10,000 to 20,000 perfect impressions per hour. The first of these type-perfecting presses manufactured by the Messrs. Hoe was erected in the office of the *New York Commercial Advertiser* in the census year.

Intimately connected with the improvement of the printing press are the inventions for the rapid handling of the printed sheets by machinery. About the time of the introduction of the Hoe cylinder press folding-machines were employed, to which the sheets were transferred as they came from the presses. To the later printing presses are attached improved folding apparatus, over which the sheets pass in continuous motion as they leave the impression cylinders, emerging finally ready for delivery. This machinery has reached such perfection that in the case of eight-page papers the sheets are not only cut in their passage through the press, but are securely pasted at the back. These attachments are now generally made to the web-perfecting presses, and it would seem that the perfection of the printing apparatus cannot go much further.

Newspaper folding machines.

TYPE-SETTING AND DISTRIBUTING MACHINES.

While all these improvements have been following each other in the printing and delivery of newspapers, the ingenuity of man has not yet invented a substitute for the setting of type by hand, the method of composition remaining precisely the same as it was when printing was first invented. As the newspapers grow larger, as they spread out into supplements, extras, double sheets, quadruple sheets, and so on, every individual letter used has to be separately handled by the type-setter, not only in the composition, but again in the distribution of the type. The process of type-setting is the most laborious feature in the manufacture of a newspaper. The average compositor will set from 800 to 1,000 ems of type an hour, rapid printers reaching an average of 1,200 and even 1,500, but the latter figure can rarely be maintained continuously. Table V shows the average ems of type set per issue on the daily press to be 74,147, but on several of our largest daily journals the average runs as high as from 400,000 to 500,000 ems, and sometimes exceeds these figures.

Type-setting and distributing machines.

The only method of increasing the speed of getting large volumes of reading matter into type is to increase the force of compositors. The aggregate ems of type set per issue on all the newspapers and periodicals of the United States reaches 556,894,022; and, bearing in mind that each of these figures represents two or more separate and distinct handlings of as many type, the immense importance of the successful invention of a type-setting machine to the periodical press may be imagined. In full appreciation of this importance, a number of the wealthiest newspaper establishments have devoted largely of their surplus earnings to experimenting with the various devices for the mechanical setting and distribution of type that have been brought to public attention from time to time. The *London Times*, in addition to its great services in the development of the printing press, has expended large sums of money in the encouragement of inventors who have sought for a successful type-setting apparatus, and the *Chicago Times* began a series of experiments with one of the latest of these machines during the census year. The first machine of the kind patented in Great Britain was the invention of William Church, the date of the patent being 1822. Frederick Rosenberg secured the first American patent in 1840, and since then there have been more than forty additional patents granted by the United States government, while the objects sought for seem as far beyond reach as ever. There is no difficulty in devising machines which will work automatically in the assortment of the types; but the difficulty arises in the necessity of devising a machine which will facilitate the composition of every conceivable variety of type and combination of letters, thickly interspersed with capitals, italics, arbitrary signs, etc. A great increase in the rapidity of composition is necessary to warrant the substitution of type-setting machinery for manual labor. Human supervision is of course necessary at every point in the operation of such a machine, and no machine can be invented that will compose type faster than an intelligent operator can read the copy. The character of the manuscript which appears in newspaper offices is so variable, often so nearly illegible, that the average compositor can set it by hand as rapidly as his eye is able to decipher its contents. The exact justification of every line of type as it is set is an operation which requires the exercise of a human intelligence, and no machine can be made to perform an operation which in no two lines is governed by precisely the same conditions in respect to spacing, the division of words, etc. It is claimed in behalf of a number of machines that they have conquered the problem of justification by providing for exactly the same distance between all the words in every line; but in practical operation the justification remains a source of apparently insurmountable difficulty. Any machine which shall be capable of automatically discharging with great rapidity an infinite number of slightly-differing operations, none of which recur with uniformity in the infinite variations which distinguish orthography, to say nothing of the variations of type—any such machine must necessarily be one of expensive and complicated arrangement and liable to frequent derangement.

Type-setting machines for book composition have long been in successful operation in several establishments in this country. The conditions governing their use in this kind of work are, however, widely different from those prevailing in newspaper offices, and nothing has as yet been devised which promises in the manufacture of a daily newspaper to reduce the cost or shorten the time required for composition.

Table V contains the statistics of the number of presses used in the printing of newspapers and periodicals. From these statistics all presses, whether hand or power, used for job printing only, or for other purposes than the printing of newspapers and periodicals, were excluded, and no account was taken of the presses used to print the large number of periodicals whose publishers did not do their own printing, but contracted with job printers. These latter instances were chiefly in the large cities, where it is the rule, except in large establishments, like those of Harper & Brothers and D. Appleton & Co., for the publishers of periodicals not of a news character to contract for their printing. In the offices of the newspapers and periodicals 8,048 presses were found, of which 4,873 were hand presses, 148 were run by water-power, and 3,027 by steam-power. There were only 122 instances of daily newspapers whose presses were worked by hand, and New York, Illinois, Indiana, Massachusetts, Maine, Rhode Island, and Connecticut were the only states in which more steam than hand presses were found. In Mississippi, where 123 journals are published, only five steam presses were found, and North Carolina, with 142 journals, returned but five.

Number of presses
used in newspaper and
periodical work.

The development of the mechanism of printing has created a revolution in journalism, and has robbed the great newspapers of the third era of many of the peculiarities which distinguished them in the days when they printed but few in number and sold them at a high price. To no cause quite as much as to this one can we justly attribute the wonderful development which has attended the American press within the last quarter of a century. But it is observable that the perfecting of the fast printing press has been going on at the same time that the extension of railroads and the multiplication of telegraph lines have enabled the great newspapers to keep pace, in the character of their publication, with the increasing facilities for making them, the railroads, with the improved mail service conducted by the government in connection with them, having made it possible for the morning journals of a great city to be delivered at the breakfast-tables of people living hundreds of miles away, while the use of the telegraph, which began to become general among newspapers by 1850, put the news of the continent within the reach of enterprising publishers for immediate publication, and was a stimulus to activity and enterprise on their part such as had been seen in the management of none of the earlier newspapers. The resources of great journals grew rapidly after the problem of furnishing them cheaply, by furnishing them in large numbers, had been successfully solved, and the increase in circulation brought with it, of course, a corresponding increase in advertising patronage. The improvements in the printing press had largely reduced the cost of producing a newspaper; but what was saved in this manner—and very much more in many instances—was expended thereafter in meeting the requirements of the widening scope of journalism. Telegraphic tolls, an entirely new element of newspaper expense, increased constantly with the increase of the service deemed necessary, and are still increasing. More and better men were employed in editorial and reportorial service, and there came in the public mind a general recognition of the importance and the responsibility of the calling of the editor and publisher of a newspaper; and as this recognition appeared, the cultivation of the peculiar kind of talent required for newspaper work brought into the profession large numbers of educated and talented men, the country demanding that those who were to instruct them as to the daily progress of the world's affairs should be men of at least as high a standard of intelligence and culture as that which was coming to prevail among the people themselves.

THE TRANSMISSION OF NEWS.

The general use of the magnetic telegraph for the transmission of news to the daily press has eliminated from the business much of the exciting and characteristic enterprise which marked the career of the daily journals in existence just previous to the successful introduction of telegraphy. Many and ingenious were the devices of rival journals to anticipate their neighbors in the publication of important intelligence, and when the event was one expected and prearranged this enterprise at first took shape in the flying of carrier-pigeons, (a) the equipment of pony expresses, with relays of spirited horses, and afterward in the chartering of special locomotives and steamboats from distant points. The achievement of Mr. Henry J. Raymond, then a reporter of the New York *Tribune*, in the first publication of a speech of Daniel Webster's, delivered in Boston, is a fair illustration of the methods adopted by one journal to surpass its rivals. He wrote out his notes of the speech while journeying back to New York on the boat, and as fast as he transcribed them the copy was passed over to printers, whose type and cases had been brought on board for that purpose. When the vessel arrived in New York the speech was in type and ready for instant publication. It was in order to anticipate its rivals that the New York *Herald* first became possessed of a swift sailing yacht in New York harbor for the prompt collection of the shipping news.

Effect of the telegraph
upon daily journalism.

With the advent of the telegraph all the journals which were able to pay the expenses of transmission were placed on precisely the same footing, with respect to priority, in the receipt and publication of news, and the ingenuity and expense formerly incurred to outstrip each other became a matter of the past. The principle underlying the associated collection of news had been recognized as valuable before the use of the telegraph, and several of the New York journals combined some years previous and jointly paid the cost of running a pony express from Washington with the latest congressional reports for their several

The associated collec-
tion of news.

^a The flying of carrier-pigeons from Halifax to Boston and New York, with condensations of the news from English newspapers just arrived, was a practice for some time successfully pursued.—Maverick's *Life of Henry J. Raymond*.

use. (a) Similar associations existed between journals both in New York and Boston for the collection of marine news. These associations were the owners of several fast-sailing news schooners, built on the pilot-boat plan. The importance of the telegraph as an instrument for the instant transmission of news was at once recognized by the press upon the opening of the first line from Washington to the city of Wilmington, Delaware, in 1844, and they immediately made use of this limited line, and as immediately found themselves in difficulty, owing to its incapacity to meet the large demands upon it with the requisite promptness. (b) As the telegraph spread its lines to more distant points this difficulty increased constantly; and it was the annoyance and delay thus arising that led to a meeting of the proprietors of the principal New York daily newspapers of that day (1848-'49)—the *Journal of Commerce*, the *Courier and Inquirer*, the *Tribune*, the *Herald*, the *Sun*, and the *Express*—for the purpose of forming an organization, or combination, to obviate the individual competition which destroyed the usefulness of the new discovery to all alike. (c) Here originated the Associated Press, and the

Organization of the Associated Press.

a The first combination was in 1846, during the Oregon excitement, resulting in dispatching a pilot-boat across the Atlantic especially for news, and in two expresses (one from Halifax and one from Boston), costing the combined papers \$5,000 for the pilot-boat, \$4,000 for the Halifax express, and \$1,000 for the Boston express—very large sums to spend for news in those days.—Hudson's *History of Journalism*.

b When the first battles were fought on the Rio Grande, the magnetic telegraph extended from Washington to Wilmington, and soon after to Jersey City. Efforts were made to reach the southern telegraph office first. Sometimes the *Herald* would succeed, and sometimes the *Sun*. Frequently the messengers of these journals would enter the office together. The exclusive use of the wire could not be given to either. They were therefore allowed fifteen minutes each. Not many lines of news could be transmitted in that brief space of time over poor lines, with miserable insulation and inexperienced operators. It was in consequence of this difficulty that the New York *Herald*, in connection with the Philadelphia *Public Ledger* and the Baltimore *Sun*, established the successful express between Montgomery and Mobile.—Hudson's *History of Journalism*.

c The idea of the associated collection of telegraphic news had an earlier conception and a successful execution in the interior of New York state. The telegraph was completed from Albany to Utica, New York, January 31, 1846; from Baltimore to Philadelphia, June 5; from New York to Boston, June 27, and from New York to Buffalo, September 9. The first state associated press originated in Utica, New York, and was a necessary sequel to the fact that the first telegraphic line was opened to general business at that point. Mr. Alexander Seward, a vice-president of the Oneida Historical Society at Utica, and formerly editor of the *Utica Daily Gazette*, in a paper read before that society December 31, 1878, gives the following interesting account of the organization of this first associated press:

"Those gentlemen who, being then connected with the press, were obliged to invent a system for availing themselves of the advantages offered by the telegraph, cannot claim any special merit for a contrivance which would doubtless have suggested itself to others similarly situated. But Mr. J. D. Reid, in his valuable history of the telegraph in America, has made a statement so inaccurate on this point that it is a duty to truth to correct it. Mr. Reid says:

"On the 4th of July, 1846, the line having been completed between Albany and Buffalo, the idea of a state associated press was practically born by a call from President Faxton for a meeting of editors, by telegraph, in the various offices at that time open. This started the idea of a federation for the supply of telegraphic news. The first daily reports to the press of the state were sent January 1, 1847. There was deposited with this society, about three months since, a volume containing the correspondence with the proprietors of the *Utica Daily Gazette* relative to the formation of this associated press. This collection had passed the ordeal of two fires and escaped the greater peril of the paper-mill. It contains about a hundred letters from those who represented the daily newspaper press of the state from Albany to Buffalo thirty-three years ago, and it may become of some historic value two generations hence, when the memories of Croswell, Ten Eyck, Lacy, Northway, Smith, Oliphant, Dawson, Butts, Jerome, Foote, Jewett, Clapp, Stringham, &c., have been further mellowed by age.

"The telegraph was completed between Utica and Albany, as before stated, on Saturday, January 31, 1846. The first news dispatch—not 'a few words', but nearly a column—appeared in the *Utica Daily Gazette* of February 3, 1846. The correspondence relative to the associated press begins contemporaneously, and continues till the association is fully organized and in complete operation from Buffalo to Albany. The cause of the organization is also apparent. Necessity was the mother of this invention, as of many others. News dispatches, chiefly brief summaries of congressional proceedings, had been telegraphed from Washington to Baltimore long before. But that government telegraph, like most government operations, was not a paying institution. The New York and Buffalo telegraph was conducted on strictly business principles from the start. It offered great benefits to the local newspapers, but it required a compensation which in their then feeble condition they were unable single-handed to pay. Hence the idea and the subsequent fact of the associated press. The daily newspapers in the state west of Utica mostly agreed to contribute to the expense of collecting and telegraphing the news from Albany to Utica, at which latter place it was printed in slips and forwarded by express in advance of the mails. Beside the proceedings of the legislature, which were telegraphed as they occurred, and the Albany market, the dispatches consisted of a summary of news made up from the New York papers as soon as they arrived in Albany. When the telegraph was completed to Syracuse, June 1, 1846, the receipt and forwarding of telegraph dispatches were transferred to the papers of that city. A meeting of the editors from Utica to Buffalo was held there to arrange matters May 28.

"The meeting of July 4, which Mr. Reid mentions, was in pursuance of the following invitation:

"T. S. F.'s compliments to the editors of all the daily papers between Albany and Buffalo: Will be happy to meet them and their friends at the different telegraph stations on the 4th, between the hours of 4 and 5 p. m., for the purpose of interchange of sentiments.

"Thus it appears that this meeting was a social gathering, of President Faxton's happy invention, to celebrate the day and the accomplishment of instantaneous communication, by the electric fluid, between lake Erie and the Hudson river. Twenty-one years before the water connection between the two had been magnificently celebrated, and the event telegraphed by cannon from Buffalo to New York. The *Gazette* of July 4, 1846, thus announced the more wonderful fact:

"THE HUDSON TALKING TO LAKE ERIE!—The lightning flashed through from Albany to Buffalo, 325 miles by railroad, this morning at 8½ o'clock. The telegraph now spans the Empire State! The events transpiring at the capital, at one end, are made known at the other extremity in 'less than no time'—from twenty minutes to half an hour before they happen. This is the longest line of telegraph in the world. The swift messengers, upon whose wings messages are sent along the copper track, are bred in a large galvanic battery in the loft of Dudley's triangle, in this city. The fluid there generated makes a circuit of 650 miles. The only object it has in view is to get from one end of the battery into the other, like a carrier-dove returning to the spot where it was trained. This fiery steed, whose speed surpasses the imaginings of tales of the genii; this mighty agent, whose sports are in the volcano and tornado; this weapon of the ancient king of heaven, forged in the infernal regions; the utilitarian of our day approaches and says: 'I'll trouble you with a line.'

"A two-column account of Mr. Faxton's novel party was given in the next *Gazette*, entitled, 'Electro-Magnetic Drama, or a Lightning Sociable,' consisting of 'single act without change of scene, as these necessities of the drama do not appertain to electro-magnetic performances'. In other words, time and space were annihilated.

"On the 5th of August the editors, from Albany to Buffalo, met in this city and extended and perfected their association, preparatory to the opening of the line to New York city, on September 9, 1846."

organized transmission of telegraphic news for the use of all these journals jointly. Arrangements had previously been made (in 1837) by the *Courier and Inquirer*, the *Journal of Commerce*, and the *Express* for the associated collection of the shipping news of the harbor of New York, and a steam vessel had been purchased and equipped for that purpose. About 1841-'43 the *Tribune* and *Sun* were added. The Associated Press was practically an outcome of this association, and after being reorganized in its present form, in 1851, very rapidly developed into an institution of great resources and wonderful ramifications. Contracts were made with the telegraph company for the transmission of news at rates much below those charged to individual customers, and great advantage was gained in this way, as well as by the division of expense, over journals not members of the association and which were not permitted to purchase its news. The Associated Press appointed its local agents in the principal cities of the Union, and made contracts with similar associations in England. After a period of time, during which its efficiency and importance had been demonstrated in connection with the continued development of the telegraph lines, it began to sell its news to newspapers in other cities and states, receiving therefor an income which went a good distance toward reimbursement for the enormous expenditure incurred in the transmission of elaborate accounts of important events all over the United States. In 1872 the Associated Press of New York city served over 200 daily papers in the United States with its telegraphic news and paid out yearly over \$200,000 for cable telegrams alone. In 1880 the Associated Press served 30 per cent. of all the daily newspapers in the United States with the domestic and foreign news of the day, and expended in the main office alone the sum of \$500,000 a year for salaries, rents, agents, and incidental expenses, not including the cost of telegraphic transmission from the points of concentration to the numerous distributing points. For this latter service the Western Union Telegraph Company received the sum of \$392,800 08 in 1880. The Census Office is under obligation to J. M. Somerville, then the press agent of the Western Union Telegraph Company, for a detailed statement of the amount of business done by that company for the newspapers connected with the Associated Press during the census year ending June 1, 1880. The total number of newspapers to which dispatches were sent was 355, of which number 228 were morning issues and 127 evening publications. These figures are significant of the greater strength and character of the morning newspapers of the United States, of which there are 438, there being 533 evening dailies. The actual number of words transmitted by the company to all newspapers during the census year was 611,199,930, which is equivalent to 1,877,256,934 ems of type. (a) It is to be borne in mind, however, that this statement of the number of words transmitted by telegraph includes the special dispatches to a large number of newspapers. The telegraph company supplies the following tabular statement, showing the distribution, by states and territories, of the daily newspapers regularly receiving the Associated Press dispatches over its lines:

a The British post-office, in its report for the year ending in March of the United States census year, shows that the number of words delivered to the newspapers of the United Kingdom in the year was 313,500,000—a trifle more than one-half the total number of words sent by one company in the United States during the same period of time.

In an address on the history and the methods of the Associated Press, delivered in 1880, Mr. J. W. Simonton, then the general manager, described the business character of the organization as follows:

Business organization
of the Associated Press.

The Associated Press is a simple copartnership, having for articles of agreement a series of written rules to govern its operations. It is not incorporated, derives no prestige or power from any special legislation or privilege, and is dependent for every element of influence, strength, or success upon its own money-capital and the intelligently applied efforts of those who established and have controlled it. The association is composed of several journals, and not of the individuals who own or control them; and so the proprietorship or policy of a journal may change without affecting its position in the partnership.

The New York city association may be called the clearing-house of a dozen different and sectional associations, which it supplies with news by contract, and from which it receives news in return. These several kindred associations exist for those sections of the country which have a community of interest and a geographical relation; thus there is a New York state association, which serves the journals of the state outside of New York city and Brooklyn; a New England association, a Pennsylvania association, a western states association, a southern states association, a Canadian association, and a Pacific coast association, besides minor associations which provide for sections of territory out of the line of those above mentioned. These kindred associations have their agents in New York city, who have access to all the news received by the city association's agent, and cull from it such and in such quantity as in their judgment is desirable for the journals of each section of the country. Thus, the western association holds toward New York relations similar to those of the New England association. It operates the territory from the lakes to the Ohio river, south to Memphis and Louisville, and west to the Missouri. Interchanging local news among its own fifty-six voting members, and eighty or more press customers who are not members, it delivers a copy of said local news to an agent of the New York association placed at Cincinnati, who forwards thence whatever in his judgment—guided by general instructions—New York requires. (a) It also reports anything within its territory which may be needed in addition to the collections for western press use; and New York is under similar and reciprocal obligations to the West; but neither association can serve any competitor or encroach upon the territory of the other. The news of the great plains, stretching from the Missouri river to the Rocky mountains, and thence to the Pacific, including California, Oregon, Colorado, Washington, Montana, Idaho, Arizona, Utah, New Mexico, and Wyoming, together with the news of the Sandwich Islands, Japan, China, and Australia, coming by way of the Golden Gate, is collected by agents of the New York association.

In all sections other than those already named the parent association makes its own collection of news; that is to say, in New Jersey, Pennsylvania (except Pittsburgh, Erie, and the oil region), Delaware, Maryland, Washington, and all points south to Texas; in Mexico, the West Indies, Canada, Southern and Central America, and Europe. Though it pays for much of its service the same rate as the general public, it brings the news of the Old World as liberally as the interest will justify from day to day. Confining itself to no arbitrary limit, its daily cable tolls are rarely less than \$300, are not infrequently \$500, and are sometimes even quadruple that sum. Its London offices are never closed. By means of a double corps of agents the news of Europe, chiefly concentrated at the British capital, is forwarded at all hours, as rapidly as received. By contracts with the great European news agencies, including the well-known Reuter Company, the Associated Press receives their news collections from every part of civilized Europe, Asia, Africa, and South America. In sparsely-settled districts, where news items are too infrequent to warrant appointments of regular agents, the telegraph companies, in order to earn the tolls, as well as for public accommodation, permit operators to act *ex officio* as agents for the press. So, too, the telegrapher's assistance is sought to improvise competent agents or reporters to visit scenes of sudden public calamity, disturbance, or other excitement at points beyond telegraphic lines, to gather the facts, carry them to the nearest station, and forward by wire. Until quite recently the Associated Press has relied entirely upon the Western Union Telegraph Company for transmission of its messages to and from all points in the United States; but now it has leased from that company, for its own special use, a wire between New York, Philadelphia, Baltimore, and Washington, and employs its own operators to work it directly between Associated Press offices in the several cities named. This proves exceedingly convenient, though it would not be economical except for the very large amount of telegraphic service (18,000 to 20,000 words daily) required by the Associated Press over that particular circuit. At Cincinnati, Detroit, Chicago, Saint Louis, Milwaukee, and Memphis condensed abstracts, known as pony reports, are made from the full one and promptly forwarded to smaller towns or outlying places in the respective districts whose journals cannot afford to share the cost of the longer one. The cost of the news, laid down where published, every charge paid, ranges from \$15 to \$250 per week to each journal, with the exception of those of New York city, who rarely find their bills as low as \$300, while sometimes they run up to \$1,500.

Thus, by its various ramifications, the Associated Press reaches to every section of the United States where daily papers are published, and, by an arrangement which is mutually beneficial, receives every day all the intelligence afloat in all the states of the Union. This association has been well described by Mr. Simonton as an independent co-operative union of newspaper publishers for their mutual benefit, the immense advantages it confers upon the newspapers which partake of its privileges being too obvious to need exemplification. It gives each one of these newspapers the advantage of all the news possessed by every other one; so that they can present in each day's issue the news of the whole country at a cost that is trifling when compared with the value of the service or the expense that would be entailed in an effort to collect it individually. This news is sent by the telegraph company, en circuits, and is dropped at office after office on the line of transmission to the most distant point in a single sending, thus greatly reducing the cost of telegraphic service to all and bringing the news within the reach of scores of the poorer papers, which, under any other conditions, would find it a burden too great for their income.

Each of the collateral associations belonging to the Associated Press makes its own rules and regulations for the admission of new members, as well as its own separate contracts with the New York city press and the telegraph company, and the advantages enjoyed in consequence are so obvious and far-reaching that membership has come to be highly prized, and has a well-defined financial value, which the journals belonging to the association hold to be an intrinsic element of their cash value. The theory of the association has grown to include the idea of protection as well as mutual benefit. To protect the members of the association from constant competition, a fixed price is established by some of the

Management of the col-
lateral associations.

^a The Western Associated Press paid \$175,000 in tolls to the Western Union during the census year.

associations as the initiation fee which new journals must pay before they can receive the benefits of the organization, and this price is generally regulated on the basis of the actual sums which the journals in the particular locality where the new publication is started have contributed to the maintenance of the system. In some cities the positive right of veto upon the admission of any new paper to the privileges of the association is accorded to each journal in that city. In New York city admission to the parent association by any new aspirant has long been regarded as impossible, and the franchise of membership is roughly estimated to be worth one quarter of a million of dollars. This feature of the Associated Press has given rise to much complaint on the part of new newspaper enterprises excluded from its benefits, and undoubtedly has acted as a check upon the establishment of new papers. It led some years ago to the organization of a similar association, served at first by a different telegraph company whose obligations were assumed by the Western Union upon consolidation. In this rival organization the sole condition of membership is the payment of the weekly dues for the collection and transmission of news; and it numbers in its membership most of the daily journals which have been founded in the last ten years, excepting always those which are founded upon the remains of preceding journals and inherit their Associated Press franchise. Many of the journals which receive their news through the new association are in a prosperous condition.

The advantages of these associations to the newspaper are obvious; they also convey obvious advantages to those who read the newspaper. Such a central responsible organization is of inestimable benefit as a guarantee of the correctness of the news received through its agency. The membership of the association is composed of journals which advocate the principles of both political parties; and one of the earliest rules formed for its guidance, as well as one that is of necessity most rigorously enforced, is that which requires all news transmitted through the Associated Press to be absolutely free from partisan bias. So well understood is this rule by the public, and so carefully is it observed, that the world has learned to regard the intelligence conveyed through this agency as uniformly trustworthy.

Advantages of telegraphic press association.

This system of co-operative news-gathering was the invention of Julius Reuter,^(a) whose European news agency now supplies the New York Associated Press with all its foreign intelligence. This agency was first organized in 1850 to supply the British newspapers with the latest continental intelligence by telegraph. It has established agents in all places of importance on the continent, who forward to the central office in London prompt and succinct reports of all happenings. From comparatively small beginnings the Reuter agency has grown into one of the most gigantic of business enterprises, and there is hardly a spot in the civilized world to which their agents have not penetrated.

Origin of co-operative news-gathering.

Connected with Reuter's company, with which it has a contract for the exclusive supply of the news of that company throughout the United Kingdom (London only excepted), is the Press Association, a limited company, whose shareholders are the proprietors of the principal provincial daily journals published in Great Britain, and is nearly counterpart to the Associated Press of the United States. This association was organized in 1868, and its operations are conducted on a scale not so extensive, but quite as thorough, as those of the Associated Press of New York. The cost of telegraphic service in Great Britain is considerably more to the newspapers than in the United States, the fact of government control of the telegraph there preventing the Press Association from making large contracts on a basis as advantageous as that which the competition of telegraph companies has made possible in this country. Large as are the sums which our newspapers pay out annually for telegraphic service, they are exceeded by the cost of this service to newspapers of equal character in Great Britain.

The British Press Association.

Admirable as is the service rendered by the Associated Press and the American Press Association, the leading newspapers of the day regularly supplement their reports from all important news centers in the United States with special telegraphic reports, which are prepared by their own correspondents, and are their exclusive property. These special dispatches do not, as a rule, traverse the news of the Associated Press, but are primarily sought for, for the purpose of imparting to it that color which the non-partisan character of the associated news compels it to omit. These specials are thus in the nature of a supplement or commentary upon the news which comes by the co-operative channel. Thus, from the national capital, where all the principal daily journals of the country employ regular correspondents, the work of transmitting the proceedings of Congress from day to day is left exclusively to the Associated Press and kindred associations, while the special reports are occupied with comments upon those proceedings, with descriptions of a day's debate, current criticism and comment, and such news and opinion as may be picked up outside of the regular channels through which comes the news of the Associated Press. This feature of special telegraphic service has grown to such great proportions of late years that it surpasses in cost the tolls paid by the Associated Press. The total tolls received

Special press dispatches.

^a Mr. Reuter, now called Baron Reuter, was the founder of the Reuter Telegram Company (limited). It was first established as a private agency, about thirty years ago. When the British government purchased the telegraph lines, the Reuter agency was transformed into a limited-liability company. Baron Reuter remained at its head as managing director until 1876, when the control was transferred to his son, Herbert de Reuter, who now fills the position of managing director of the company.

by the Western Union Telegraph Company in 1880 for the transmission of press reports was \$1,085,655 35, (a) of which amount \$690,855 27 was paid for special dispatches and \$392,800 08 for Associated Press dispatches. In comparing these figures, it is to be borne in mind that the telegraphic company received one rate for the Associated Press dispatches sent to all the papers in each circuit, while it received a separate rate for specials from each individual newspaper sending them, so that the greater sum paid for specials is not an indication that the Associated Press dispatches were less in amount of words than those specially sent. On the contrary, they many times exceeded the latter in volume. The largest amount paid by any single newspaper for press dispatches during the year was \$70,006 31. In recent years a number of the leading newspapers have leased telegraphic lines to the national capital, of which they have the exclusive use, transmitting large volumes of matter for publication through the agency of special operators in their employ.

The growth of this branch of newspaper enterprise, which has assumed its great proportions in comparatively recent years, is one of the chief elements of the increasing cost of daily newspaper publication. The time has long since passed when news of any importance can be intrusted to the slower carriage of the mails, and the cost of telegraphing eats up the profits of many thousands of copies of papers sold, the effect of the telegraph upon journalism having been to revolutionize its method and its character, and to add immeasurably to its capability for aiding and serving the public.

The influence of the telegraph upon the journalism of the United States has been one of equalization. It has placed the provincial newspaper on a par with the metropolitan journal, so far as the prompt transmission of news—the first and always to be chiefest function of journalism—is concerned, and thus it has compelled the assertion of superiority on the part of individual newspapers, by the employment of more and better brains and the making of a better journal in all those features where brains tell. More than any other cause, the use of the telegraph has thus tended to raise the standard of journalism, while it has immeasurably increased the value of the press to the business and other interests of the country.

JOURNALISTIC DIFFERENTIATION IN THE UNITED STATES.

The most striking feature of the history of the newspaper press during the past decade has been its multitudinous differentiation, the press of the United States, to a marvelous degree not witnessed in any other country, accommodating itself to the several conditions and pursuits of the people. In its early development all papers were established on the same plan, and discharged the single function of conveying at regular but infrequent intervals the news of the day. The first variation was one of party, to fit the different lines of popular thought, and this was accompanied by the introduction of editorial opinion. Thus began, long previous to the American revolution, the first grand division of the American secular press upon party lines. (b) This division, as has been seen, was rendered more marked and intense subsequent to the revolution by the fierceness of the partisan feeling which characterized the early years of national existence under the Federal Constitution, and partisanship stimulated the growth of the press, and claimed nearly every publication among its votaries. Publications that were purely literary in their character had, it is true, made their appearance long prior to the revolution, and continued to appear and disappear at regular intervals; but the main peculiarity of the American press, as we find it reflected in the files for the first half century after its secure establishment, was its division on party lines and its reliance upon partisan feeling for nutriment. Naturally this characteristic, which was the first to develop, continues to be the most important down to the date of this report. Two-thirds of all the publications in the United States to-day are known as political papers, and are devoted in their editorial columns to the advocacy of the fortunes of one or another of the existing political parties, and the activity and intensity of our political life continues to contribute to the rapid development of the American press, notwithstanding the marked decadence of the old-fashioned party "organ", which has come in company with larger resources and greater independence. By way of illustrating the reflex relationship between politics and the press, it may be stated that several years ago, when the so-called national greenback party first began to effect an organization in the several states, new papers followed everywhere in its wake, incited to existence by the fervor of

Journalistic differentiation.

Political character of American journalism

The greenback party and the press.

a In 1866 the total receipts of the telegraph companies for press dispatches were \$521,509, and the volume of service has very much more than doubled in the interval, however, as the lesser rates now charged indicate. The average cost of press telegrams in 1866 was 3½ cents per word; but under the operation of contracts, it has now been reduced far below that figure, even for special telegrams.

b For many years, however, this distinction remained vague and intermittent. William C. Bryant illustrates this fact by the following examples: "In the *New York Evening Post*, during the first twenty years of its existence, there was much less discussion of public questions than is now common in all classes of newspapers. The editorial articles were mostly brief, with but occasional exceptions; nor does it seem to have been regarded, as it now is, necessary for a daily paper to pronounce a prompt judgment on every question of a public nature the moment it arises. The annual message sent by Mr. Jefferson to Congress in 1801 was published in the *Evening Post* of the 12th of December without a word of remark. On the 17th a writer, who takes the name of Lucius Cassius, begins to examine it. The examination is continued through the whole winter, and finally, after having extended to eighteen numbers, is concluded on the 8th of April. The resolutions of General Smith for the abrogation of all discriminating duties, laid before Congress in the same winter, was published without comment; but a few days afterward they were made the subject of a carefully-written animadversion, continued through several numbers of the paper."—*Reminiscences of the First Half Century of the New York Evening Post*: New York, 1851.

propagandism, and reflecting, in their varying fortunes, the unpropitious fortunes of that organization; and in some of the western states, where the greenback movement was the strongest, it brought into existence papers which found sufficient nutriment to live, and which will continue to live, without reference to the future of that organization. But, as a rule, the journals which were born with that mission only (and their name was legion) have already ceased to exist. In forcible illustration of the instability of newspaper enterprises, it may be mentioned that there were one or two journals established in large cities, as the central "organs" of this political organization, which reached for a time weekly circulations exceeding one hundred thousand copies, but have already passed out of existence; and the whole story of American journalism is a similar evidence that partisanship, which brings so many papers into the world, is not a safe, stable, or sufficient basis for journalistic prosperity.

Hence it happened that with the lapse of time the political principles advocated by existing journals came to be an incident of their being rather than a *raison d'être*. Alliance with one or the other of the political parties is still generally looked upon as essential both to the character and the success of the average newspaper, but it is less and less regarded as a sufficient mission or a guarantee of success. For this reason, as well as for others which naturally suggest themselves in connection with an official government inquiry, no attempt was made, in getting these statistics, to effect a political classification of the American press.

No political classification of the press attempted.

AS TO FREQUENCY OF ISSUE.

The second natural differentiation in the development of the American press had relation to the time of publication and the convenience of the public in its supply with freshest news. For many years the weekly issue was all that American enterprise dared to attempt. In 1729 the first semi-weekly paper was attempted by Benjamin Franklin in Philadelphia, and semi-weekly issue, were frequently attempted in that city, as well as in Boston (*a*) and New York for a number of years previous to the revolution. The infrequency of mail communication with the old country and the irregularity of news advices from the neighboring colonies made the semi-weekly issue, however, more of an undertaking than the times warranted, and, as a rule, they were not successful.

The second differentiation.

Semi-weekly newspapers founded.

In 1770, when Thomas began the publication of the *Massachusetts Spy*, he undertook to issue it three times a week, on Tuesdays, Thursdays, and Saturdays, twice a week to be printed on a quarter sheet and once on a half sheet. "When published in this way," as Mr. Thomas himself wrote in describing the enterprise, "news was conveyed fresh to subscribers, and the contents of a *Spy* might with convenience be read at a leisure moment." Three months only the *Spy* ran as a tri-weekly, and but three months longer as a semi-weekly; and when it appeared March 7, 1771, as a weekly, it was a concession that all the energy and enthusiasm of the most energetic and enthusiastic printer of colonial times could not succeed with a more frequently published paper.

With the stirring times of the revolution, when news of public concern was hourly expected and received, a natural device was adopted to meet the public demands without incurring too great an expenditure on the part of individual publishers. In the large cities, where several weekly papers were regularly published, they appeared upon successive days of the week, and were thus made supplementary to each other. By this expedient New York was furnished with a daily paper during the greater part of the revolutionary war, an arrangement having been entered into by the publishers of the four existing papers by which Rivington's *Royal Gazette* was to be issued on Wednesday and Saturday, Gaine's *Mercury* on Monday, Robertson, Mills & Hicks' *Royal American Gazette* on Thursday, and Lewis' *New York Mercury and General Advertiser* on Friday. These papers were all issued under the sanction and authority of the British commander-in-chief.

It was the excitement of the war which led to the founding of the first daily newspaper in the United States. This was the *American Daily Advertiser*, published in Philadelphia in 1784, eighty-two years after the first daily had been attempted in London, and seven years later than the first establishment of the *Journal de Paris ou Poste du Soir*, the first daily paper regularly attempted in Paris.

The first dailies founded.

Notwithstanding their difficulties and struggles, these first dailies met a want of the larger cities to which they appealed for support; and they grew stronger with the growth of the cities and were rapidly followed by others, which also lived, relying for support largely upon the patronage of the cities themselves, in the absence of means for rapid communication with the rural districts. It was nearly a quarter of a century thereafter before the smaller cities of the United States began to enjoy the privileges of daily newspapers; for while they were unfolding their resources they were content with the weekly issues that had marked the early history of the metropolitan cities. (*b*)

Spread of daily journalism.

All of the twenty-seven daily newspapers in existence in 1810 were printed in the seven cities of Philadelphia, New York, Baltimore, New Orleans, Alexandria, Virginia, and Charleston and Georgetown,

a At the commencement of the second year of publication of the *Boston Chronicle*, the paper was changed from a weekly to a semi-weekly, and published Mondays and Thursdays, without an increase in price. It was published for a year and a half.

b The newspaper of that day (1787-1815) was a very different commodity from that which is now spread before the country every hour of every day in the year. It was small, rusty in appearance, generally in some kind of a fight, and, of course, without the benefit of steamships, telegraphs, lightning expresses, or any of the complicated agencies by which news is now collected and dispatched.

South Carolina, Boston, Providence, Albany, Wilmington, Annapolis, Washington, Richmond, Norfolk, Petersburg, and Savannah being still served by weekly and semi-weekly papers, with an occasional tri-weekly in Washington, Savannah, and Norfolk.

The first daily newspaper in Albany, New York, the *Daily Advertiser*, appeared in September, 1815, and Rochester followed with a *Daily Advertiser* in 1826. Semi-weeklies had preceded the first Albany daily in 1788. The first Cincinnati daily, the *Commercial Register*, appeared in 1826. As the western cities, of marvelous suddenness of municipal development, sprang into being, one after another, the daily newspaper always made its prompt and confident appearance in the field. The 27 daily papers of 1810 had increased to 138 by the census of 1840, 254 by 1850, 387 by 1860, 574 by 1870, and 971 by 1880. The first attempt to estimate the number of copies of daily newspapers printed annually was made in the census of 1850, when the aggregate was put at 235,119,966. The census of 1860 placed the circulation of daily newspapers at 1,478,435, but neglected to give the annual aggregate of copies printed, while that of 1870 placed the total circulation at 2,601,547, and the number of copies annually printed at 806,479,570. The census of 1880 shows a daily circulation of 3,566,395, and an annual aggregate issue of 1,100,607,219, the increase in the number of daily newspapers between 1870 and 1880 having been 69 per cent., while the increase in their circulation has been but 37 per cent.

THE PROVINCIAL DAILY PRESS.

In no direction has the development of American journalism been so gratifying and significant as in the growth of what may be called the provincial daily press, for the want of a better designation. This growth has been stimulated by both the railroad and the telegraph—perhaps chiefly by the latter. The use of the telegraph enables the newspapers published hundreds of miles away from the commercial and news centers to supply their readers with the latest information of events therein contemporaneously with its publication in the metropolitan dailies, and the effect has been to confine the circulation of the journals of a particular city within clearly defined radii, determined by the nearness to another city in which a daily journal is published. The same tendency has been strikingly illustrated in England through the operation of the same causes, and a recent authority, dwelling on this phase of the subject, has declared that “the English provincial press is now fairly on a level with its London competitors”, the Manchester, Leeds, Hull, Liverpool, and Edinburgh journals no longer leaving room in their respective towns for the London *Times* and *Telegraph*. Until the railroad and the telegraph came to the assistance of publishers in interior towns, both in England and the United States, all the latest intelligence, inaccessible to them, centered in the metropolitan towns, and there remained until the great dailies gathered it up and scattered it through the country. The provincial press was impotent to cope with them, because it lacked facilities to supply what the newspaper reader wants first and chiefly—the news; and, behind in that, it naturally remained behind in everything else, and became a servile imitator in tone, temper, and opinion. But different localities have different and often conflicting interests, and growing communities, as they yearly become more closely connected by wire and rail with the commercial centers, sever their reliance and dependence in other particulars. So the provincial newspaper, representing interests which its metropolitan contemporary does not reach, becomes, first, a home necessity; second, an independent, self-reliant necessity; and, third, the rival, if not the peer, of the great sheets that issue from the metropolitan press. Thus the scope of the more prominent individual journals in the United States—journals which have lost none of their prosperity or their ability—is becoming less and less national and more and more merely metropolitan.

This change in journalism is simply one illustration from many of a change which reaches all departments and phases of national life, and it has gone on hand and hand with the growth of great interior cities like Chicago, Saint Louis, and Cincinnati. We find to-day in these cities newspapers which are in no sense inferior to those published in New York, and, in some particulars, in individual cases, their unmistakable superiors. The newspapers of Chicago, regarding them as a whole, are the equals of the New York press in the lavishness of their expenditure for the collection of news of every description, and in the ability and discretion with which they present it.

A given number of newspapers in Chicago print regularly more reading matter, on larger sheets, than the same number of papers in New York. The same statement is probably true of the Cincinnati dailies. In all the larger interior towns of the United States there have grown up newspaper establishments which are capable of supplying all the newspaper wants of their busy and commercial population; and to this kind of development must be attributed the decadence of certain journals which at one time or another have

instantaneously over the civilized world. The great event of the close of the last century, the death of Washington, was unknown in Boston until eight days after its occurrence. The latest news from Philadelphia on the morning of the 1st of January, 1800, was six days old, and from many of the towns of Massachusetts was hardly better. * * * Many worthy persons thought even this sleepy method was much too rapid. John Pickering, the uncle of Timothy, was made very unhappy when, in 1796, the *Salem Gazette*, which had been printed weekly till that time, began to appear twice a week. “It never had been printed but once a week,” he said, “and that was often enough. It was nonsense to disturb the people’s minds by sending newspapers among them twice a week, to take their attention from the duties they had to perform.”—Delano A. Goddard’s *Newspapers and Newspaper Writers in New England*: Boston, 1880.

exercised so marked an influence upon American affairs. The best illustration of this class is the *National Intelligencer*, which existed for so many years at Washington, and, under the able management of Gales & Seaton, exercised an influence upon the politics of the United States which was truly national, as its circulation extended into every state of the Union. Its decadence was due to no fault of its own, but to the development of the provincial press. In like manner it is not to be expected that hereafter any single newspaper, like Horace Greeley's *Log Cabin* of 1840, will ever be able to attain an influence commensurate with that which this lively campaign sheet briefly enjoyed. The power of the press has been infinitesimally subdivided by this development, and the dangers which some of our earlier statesmen foresaw in the growth of a newspaper aristocracy, by the concentration of the influence of the press about a comparatively few journals advantageously located in commercial or political centers, have long since ceased to be even imagined. The press of the United States now voices the varying views of thousands of minds, and represents the often conflicting and competing interests of many sections and of all the states. Its whole history since the close of the second or transitional era has been one of decentralization of influence as to individual journals, while it has witnessed at the same time the strengthening and consolidation of the resources of a comparatively small number of the existing newspapers. Both of these tendencies in growth will be generally recognized as natural, healthy, and in accordance with the genius of our institutions. (a)

Decentralization of the influence of the press.

MORNING AND EVENING NEWSPAPERS.

The secondary differentiation of period of the frequency of publication in connection with the daily press has arisen in connection with morning and evening editions and frequent editions during the course of the business day. The first daily papers were all published in the afternoon. The *Daily Minerva*, which was started in New York by Noah Webster, the lexicographer, in 1793, as an organ of the Federal administration, appeared, according to its own statement, "every day, Sundays excepted, at four o'clock, or earlier, if the arrival of the mails will permit." With the *Minerva* was connected a semi-weekly paper, called the *Herald*, the contents of which were "lifted" from the daily forms and arranged for country circulation. The name of the *Minerva* was changed to *Commercial Advertiser* very shortly, and it still exists, under the management of Hugh J. Hastings, the oldest paper in the metropolis.

Morning and evening daily newspapers.

The afternoon or evening papers, as the present statistics show, continue to exceed in number the morning publications. This is natural, and may be ascribed to the comparative cheapness of the afternoon publication. Night service, whether on a newspaper or elsewhere, is more expensive than day service; and the afternoon journal is able to publish with less expense for the collection of news and with a smaller editorial force for the same amount of work than is required for the morning issue. This is more strikingly the fact to-day than it was in the earlier history of the daily press of the United States. The morning metropolitan journal is expected to publish full accounts of the happenings of the previous day up to the moment of going to press, and this requires in large cities a large force for evening work, including frequently stenographers and special correspondents at different points. All the information gathered by the morning press in this way is accessible to the afternoon journals of the same day from the printed copies, and may be condensed or rearranged by a comparatively small editorial force. The fact that the great majority of these latter journals go to press while the business of the day is yet in progress makes it possible for them to gather the news with comparative ease and with a corresponding curtailment of expenditure, and the same causes operate to give the morning journals, although fewer in number, a considerably larger aggregate circulation than that enjoyed by the afternoon or evening journals. The census of 1880 is the first one in which the daily newspapers have been separated into morning and evening classes, and no data therefore exists for determining the comparative rate of increase in the two classes.

Comparison of morning and evening newspapers.

The demand of thickly-settled communities for frequent information has led to the multiplication of editions, especially on the part of the journals issued in the afternoon. Except for the purpose of catching early trains with mails to outside points, it is not the custom for morning journals to issue more than one edition, which they have ready for the public at the early breakfast hour; but it is frequently the case that one establishment will publish both morning and evening editions, (b) and

The multiplication of editions.

^a The same influences have worked the same results in Great Britain. Mr. James Grant, in his *History of the Newspaper Press*, speaking of the present status of the provincial press of that country, says: "Neither mechanically nor intellectually will the provincial press suffer in the slightest degree from a comparison with the London metropolitan press. They exercise a mighty power over the public mind in the various localities where they are published. In this way the provincial press is rapidly trenching on the power and the prerogatives of the London journals; and, as the former continue to multiply in number, and weekly journals are rapidly becoming twice-a-week papers, and these, in turn, are becoming daily papers, it is my firm persuasion that before ten years have elapsed we shall see our provincial journalism exercising an influence on the public mind even mightier than that which is exercised by the metropolitan press."

^b In 1796 a small paper, half a sheet medium, quarto, entitled the *New World*, was published at Philadelphia every morning and evening, Sunday excepted, by the ingenious Samuel H. Smith, afterward the editor of the *National Intelligencer*, published at Washington. The novelty of two papers a day from the same press soon ceased; it continued but a few months. This paper was printed from two forms on the same sheet, each form having a title, one for the morning and the other for the evening; the sheet was then divided, and one-half of it given to the customers in the forenoon and the other in the afternoon.

from three to four separate editions of the latter. This inquiry discovers twenty such establishments in the United States: one located in each of the states of Alabama, Georgia, Illinois, Maryland, New Hampshire, and Vermont; two in Louisiana and in Rhode Island; three in Ohio and in Pennsylvania; and four in Massachusetts. The morning and the evening newspaper from the same establishment being in every essential respect distinct newspapers, they have been so enumerated and counted in this report.

The evening papers and the evening editions of the morning papers are accustomed to put out a first publication early in the afternoon, and to follow it at intervals of an hour or oftener, according to the importance of the current news, until six o'clock—the later editions being identical with the earlier, except in the addition of the later telegraphic and other news. (*a*) These later editions are generally sold on the streets by newsboys and at stands, and are rarely distributed to regular subscribers.

The experiment of noon papers has been frequently tried in the United States, and five such journals were published in the census year. One noon paper was published in Pennsylvania, two in New York, and in California noon editions of two evening newspapers were published; but as a rule this is not an hour when the news of the morning journals can be sufficiently supplemented to create a demand for such issues, or when the public is in a mood for newspaper reading. The daily journals which are published at that hour are chiefly of a commercial character.

This inquiry has developed the fact that 725 of the 971 daily papers publish weekly editions in connection with the daily issue, 41 publish semi-weekly editions as well as weekly, and 41 publish tri-weekly editions, generally in connection with weekly and semi-weekly editions, although it is commonly the case that the tri-weekly is substituted for the semi-weekly. The custom of publishing a weekly edition in connection with the daily began with the earliest daily journals in this country. They were for the benefit of subscribers beyond the limits of the city of publication and only reached at that time by infrequent mails, and have grown to be one of the most lucrative features of the business. As a rule, the matter which appears in the several daily issues is selected and rearranged for the weekly sheet, so that the cost of publishing the latter is very largely reduced. These weeklies are formidable competitors of the weekly press proper, because, while furnished at the same price, or frequently at a less price, they contain a larger and better amount of reading matter than the latter can afford to supply. The aggregate circulation of the 804 weeklies connected with dailies is nearly one-quarter that of the remaining 7,829 weekly newspapers and periodicals of all classes and descriptions. Some of these weekly reprints of the daily journals reach a circulation almost phenomenal, extending from the cities of New York and Chicago into most of the states of the Union. Where these large editions are published, it is found profitable to add largely of reading matter, which is prepared especially for the weekly issue, and appears nowhere else.

SEMI-WEEKLY AND TRI-WEEKLY PAPERS.

The semi-weekly and tri-weekly papers are not common in this country, the census revealing only 133 of the former class and 73 of the latter in the United States, including those which are published in connection with the daily press. It is worthy of particular notice, as an evidence of the conclusion arrived at regarding papers of these periods of issue, that 41 of the 133 semi-weeklies were connected with dailies and 41 of the 73 tri-weeklies—more than half—were likewise connected. Except as an adjunct to the publication of dailies, experience has not proved either class to be profitable; and as a rule the circulation of these semi-weekly and tri-weekly papers is uniformly smaller than that of the weeklies of the same grade.

The difficulty appears to be that, while the frequency of issue is not sufficient to enable these journals to serve as a substitute for the daily paper, it does not give sufficient advantage over the weekly issue to compensate the average reader of the latter for the added cost. This is especially true of the tri-weekly press, in the establishment of which there have been more failures in proportion to the number of successes than with any other class of periodic issues. Both the semi-weekly and the tri-weekly journals necessarily publish news which is more or less stale in localities that are accessible to the daily press, and in that respect they have but little advantage over the weekly. In all other localities they are found, as a rule, to be the basis of daily establishments, or after a brief experiment they are likely to revert again to the weekly period of publication.

As evidence of the accuracy of this conclusion, it will be noticed that the number of semi-weeklies published in 1870 (115) had only increased to 133 in 1880, while the number of tri-weeklies actually decreased from 107 to 73. The circulation of semi-weeklies was 247,197 in 1870, and had only increased to 258,652 in 1880, while the circulation of tri-weeklies decreased from 155,105 in 1870 to 72,910 in 1880. An examination of the schedules returned has convinced me that the great majority of the papers returned as tri-weeklies in 1870 are reported as dailies in 1880, where they continued to exist.

a The Boston *Evening Traveller* regularly publishes five editions every afternoon, except Sunday, and there are several other papers which do the same. The usual number of editions, however, is three or four.

CLASS AND SPECIAL JOURNALISM.

The next process of differentiation that has been conspicuous in the development of American journalism concerns wholly the periodical press, and has been in the direction of class and special publications. Here the range has been wide, indeed, and is continually growing wider. This special or class journalism, as it may properly be called, originated in England, and has reached a development there which is only exceeded by that observable in the United States. It had its origin in this country with periodicals devoted to literature and literary topics, of which there were a number founded in Massachusetts previous to the revolution, none of which met with any marked degree of financial success, or were able to perpetuate themselves beyond the first few years of experiment.

Origin of periodical and class journalism.

Colonial periodicals.

One of the first of these, if not the first, was the *Boston Weekly Magazine*, founded in 1743, but existing only for four weeks, in which were reproduced extracts from the London magazines, original poems, and miscellaneous reading matter. The *American Magazine and Historical Chronicle*, founded at the same place in the same year, lived for three years and four months, and was a very creditable imitation of the *London Magazine*. It published "dissertations, letters, essays, moral, civil, political, humorous, and polemical", together with a variety of miscellaneous reading matter, including summaries of the current news of the previous month. The *New England Magazine of Knowledge and Pleasure*, containing sixty pages, 12mo, did not survive, in 1758, its fourth monthly number.

Isaiah Thomas also made a venture in this class of periodical in 1774, which he named the *Royal American Magazine, or Universal Repository of Instruction and Amusement*. Each number contained three sheets of letter-press and two copperplate illustrations, and it is believed to have been the first illustrated journal published in this country. There were only six numbers of this magazine issued, the revolutionary war compelling the suspension of such an ambitious venture.

A similar experiment was made in New York in 1752, entitled *The Independent Reflector*, printed weekly, and containing moral and political essays, but no news. It was sustained for two years by a society of the cultured gentlemen of that city, who contributed to its contents, but were not able to make it a profitable venture. A *New American Magazine*, monthly, with forty pages, octavo, by James Parker, was begun at Woodbridge, New Jersey, in 1758. It was a publication of marked merit, but although there was then but one similar periodical in the whole of the colonies, it was discontinued at the end of twenty-seven months for lack of support. The one similar contemporaneous magazine was *The American Magazine, or Monthly Chronicle*, published in Philadelphia, which was established the year previous to the New Jersey journal, and died the same year. There were several similar ventures in Philadelphia previous to the revolution which met with the same fate, with which the names of Benjamin Franklin and William and Andrew Bradford were connected, either as publishers and printers, or both. The most celebrated of these, the *Pennsylvania Magazine*, owed its repute chiefly to the frequent contributions of Thomas Paine. The field may therefore be said to have been well tested, and proved unprofitable.

Early New York periodicals.

Early Pennsylvania periodicals.

The present century opened somewhat more auspiciously for periodicals of this class, the first number of the famous *Portfolio* making its appearance in January, 1801, and this was followed in 1803 by the *Monthly Anthology*. This latter periodical, which drew its contributions from a volunteer corps of cultured Boston gentlemen, inspired in New England a literary taste and a love for letters which have been estimated very highly among the educating influences of the period; but it had been discontinued for several years before the influences which had become associated through it led to the establishment of the *North American Review*, founded in 1815 by William Tudor. This magazine was originally published every two months, in numbers of 150 pages each, and included in its contents, beside reviews, the variety of miscellaneous and poetical articles usually found in this class of periodicals; and in the course of a few years it passed into the control of an association of literary gentlemen, who met regularly in their editorial capacity. The *North American Review* passed through other changes in its earlier years, and many men directed its pages, but with a singularly uniform regard for the best standards of literary taste. The *Review* has contained many articles which entitled it to even rank with the higher class of the English reviews, and its files afford the best collocation of the American critical, literary, political, and scientific thought for the last seventy years. The zeal of a few individuals has kept this periodical alive through several crises, which gave evidence that the tastes of the American people were not responsive to their efforts.

The *North American Review*.

THE MONTHLY MAGAZINES.

Publications of the severely critical class, never very popular in the United States, have been rendered even less so by the marked success of the popular monthly magazines.

The magazine literature of the United States, taken all in all, is perhaps the most distinctive and creditable feature of our entire publishing interests. This interest has grown in a comparatively brief period to equal, both in volume and variety, the magazine literature of Great Britain, and includes several types of what may be properly styled the purely American magazine—types which are not even imitated elsewhere, and are not rivaled by the best products of the English periodical press.

The magazine literature of the United States.

Their peculiarity consists of the somewhat heterogeneous character of their contents, and the commingling in their pages of prose and verse, fiction, description, historical papers, moral or amusing essays, summaries of current events, literary criticism—all supplemented of late years by the best class of illustrations, which have come, in the end, to be their most attractive feature, and the one which chiefly marks them in comparison with similar periodicals now published in England on the same model.

The best types of the distinctively American magazine are *Harper's Monthly* and *Scribner's Monthly*—the latter now known as *The Century*. The former was established by the Messrs. Harper in 1850. It was at first, and for a considerable period, chiefly an eclectic magazine, containing the choicest articles from the English periodical press, with occasional original contributions. There had previously been popular periodicals without number projected in the United States, most of which lived but a brief life, and did not appear to meet a public want. The most notable exception to this rule was the *Knickerbocker Magazine*, established in New York in 1832, and crowded out of existence in 1860 by younger rivals, which succeeded better in meeting the requirements of the popular taste. *Putnam's Magazine* (1853-'57) was another early venture of this character which enlisted many of the best writers of the country, and was an admirable type of the higher periodical magazine.

Harper's Magazine very soon abandoned its purely eclectic character, enriching its columns with the productions of the best American authors, including more especially sketches of travel, fiction, science, history, and poetry, and it added immensely to its prestige and popularity by the profuse and elegant illustrations which adorned its pages. At one time or another nearly every well-known author in the United States has contributed to the columns of *Harper's Magazine*, and the foremost English novelists have regularly supplied it with stories contemporaneously with their publication at home, receiving therefor the same remuneration given by the home publishers. The success of *Harper's Monthly* has been commensurate with the enterprise, good taste, and ability uniformly displayed in its management. Its sixty volumes, extending uninterruptedly over the thirty years that have marked the development of American literature and the stalwart growth of the American periodical press, are to-day an unsurpassed monument of the publishing interest in the United States.

Scribner's Monthly, projected by James G. Holland and Roswell B. Smith in 1870, is a younger but no less distinctive example of the best American periodical literature. Its success, like that of *Harper's Magazine*, may be attributed largely to the cosmopolitan character of its contents, and it has succeeded marvelously in striking the average taste of the American reading public, while refusing to pander in the least degree to the vicious or the sensational. In its typographical and artistic features *Scribner's Monthly* presents a model of excellence which is believed to be unrivaled by any European magazine of like character.

The features of these two magazines which may be said to have determined their success are of American conception, and do not find their parallel on the other side of the water, and it is not surprising that they should both command large sales in England as well as in the United States. It may be said of them generally that they are light without being frothy, and that by the variety of their contents they supply healthy nutriment for the varied tastes of the entire family circle. In this respect, as well as by their illustrations, they present their chief contrast to the leading periodicals of Great Britain, and more especially to the quarterly and latterly to the monthly reviews, which hold the first place in English periodical literature.

Much the same degree and quality of praise is due to *Lippincott's Magazine*, *Appleton's Journal*, and several younger but sturdy monthlies which have been born during the census decade in both eastern and western cities. The *Atlantic Monthly*, founded in Boston in 1857, has enriched our literature with a class of criticism, fiction, and poetry higher and more enduring than that which has marked the contents of any other American magazine, and the influence of this periodical in popularizing the best reading matter cannot be easily overestimated. It has become the recognized function of the American magazine to occupy a clearly-defined middle ground between the newspaper press and book literature. The newspaper press aspires to absorb all the functions of the magazine by dealing in criticism, in fiction, in historical study, in sketches of travel, and in the presentation and discussion of social and moral questions; but from its very nature it can never crowd the latter out of its acknowledged field. Journalistic work in these fields is necessarily cursory, and is too often slipshod. On the other hand, the magazine is coming to be more and more accepted by every class of writers in the United States, as well as in England, as the proper and desirable medium for the first introduction of their writings to the public. Nearly if not quite a majority of American books of the popular or untechnical character now appear first in the magazines, either serially or by piecemeal, as in the case of fugitive poetry, essays, and critiques. This custom has given a dignity and importance to the periodical press of the nation which it struggled in vain to reach in the earlier half of the present century. The circulation of the purely literary magazines of the class we have been describing is shown by the census inquiry to have reached 548,552 copies per issue in the census year.^(a)

^a The best summary of the successive literary periodicals of the United States is that in *Appleton's American Cyclopædia*, which, by the courtesy of the publishers, is here reproduced:

"Reversing the rule which had prevailed in the Old World, the United States, as was natural in a new country where scholars and

THE WEEKLY LITERARY PRESS.

The attempt to establish weekly papers of a literary and critical character has been constantly made for a half century past, and the outlay of capital, brains, and enterprise has generally been attended with disaster. Experiments of this character have become more rare of recent years, chiefly because of the omnivorous methods of the daily press in covering all the varieties of reading matter which in the old days were regarded as the peculiar province of the journals of which I am now speaking.

institutions of learning were as yet few, had its journals of entertainment long before its journals of erudition appeared. The date of the first literary periodical is 1741. In that year Franklin issued the *General Magazine and Historical Chronicle*, at Philadelphia, on the plan of the *Gentleman's Magazine*; but it existed only half a year, while of the *American Magazine*, begun in the same year and city by Webbe, two numbers only were published. The other issues of the kind prior to the revolution were mostly short-lived. They were the *American Magazine and Historical Chronicle* (Boston, October, 1743, to December, 1746); the *Boston Weekly Museum* (4 numbers, 1743); the *Independent Reflector* (New York, 1752-'54), which numbered among its contributors Governor Livingston and the Rev. A. Burr; the *New England Magazine* (Boston, 1758), which ceased after the appearance of a few parts; the *American Magazine* (Philadelphia, October, 1757, to October, 1758), published by Bradford; the *North American Magazine* (Woodbridge, New Jersey, 1758-1766), by S. Nevil; the *American Magazine* (Philadelphia, 1769), by Nicols; the *Royal American Magazine* (Boston, 1774-'75); and the *Pennsylvania Magazine* (Philadelphia, 1775), commenced with articles by Thomas Paine and others, but interrupted by the war. After the conclusion of peace, and before the end of the century, came the *Columbian Magazine* (Philadelphia, 1786-'89), edited at first by Carey, who abandoned it to undertake the *American Museum* (1787-1797), a compilation from the newspapers and other journals of the time of much historical value; the *Massachusetts Magazine* (Boston, 1789-1796); the *New York Magazine* (1790-1797); the *Farmers' Museum* (Walpole, New Hampshire, 1793), edited from 1796 until near the close of the century by Dennie; the *United States Magazine* (Philadelphia, 1796), by Brackenridge; the *American Universal Magazine* (Philadelphia, 1797); and the *Monthly Magazine and American Review* (New York, 1799-1800), founded by the novelist C. B. Brown, but carried on afterward as the *American Review and Literary Journal* (1801-1802).

"It would hardly be possible to give a complete list of the numerous literary miscellanies which have been undertaken since 1800 in the principal cities of the Union. A large majority of them never succeeded in obtaining anything like success or permanence. Among them were the *Portfolio* (Philadelphia, 1801-1825), by Dennie, the first American periodical which reached an age of over ten years; the *Literary Magazine* (Philadelphia, 1803-1808), by C. B. Brown; the *Monthly Anthology* (Boston, 1803-1811), containing articles by Tudor, Buckminster, Thacher, Kirkland, J. S. J. Gardiner, J. Q. Adams, and G. Ticknor; the *Literary Miscellany* (Cambridge, 1804-1805); the *General Repository* (1812-1813), at the same place; the *Mirror of Taste* (Philadelphia, 1810-1811), by Carpenter, who paid much attention to dramatic matters; the *Monthly Register* (Charleston, 1805), the first southern periodical; *Literary Miscellany* (New York, 1811), by Baldwin; the *Analectic Magazine* (Philadelphia, 1813-1820), designed especially for officers in the navy, and edited in 1813-1814 by Irving; the *New York Weekly Museum* (1814-1817); the *Portico* (Baltimore, 1815-1819); Buckingham's *New England Magazine* (Boston, 1831-1835); the *American Monthly Magazine* (New York, 1817-1818); the *Literary and Scientific Repository* (New York, 1820-1821); *Atkinson's Casket* (Philadelphia, 1821-1839), displaced at last by *Graham's Magazine*, which from 1840 to 1850 was the best of its class in America; the *Atlantic Magazine* (New York, 1824-1825), by Sands, continued until 1827 as the *New York Review*; the *Southern Literary Gazette* (1825); the *New York Mirror* (1823), begun by Morris and Woodworth, the latter being succeeded by Fay, who gave place to Willis, from which time till 1842 Morris and Willis successfully conducted it; the *Illinois Monthly Magazine* (Vandalia, 1830-1832), the earliest literary publication in the West, edited by J. Hall, who superseded it by the *Western Monthly Magazine* (Cincinnati, 1833-1836); the *American Monthly Magazine* (New York, 1833-1838), established by Herbert and Patterson, and subsequently edited by Park Benjamin; the *Gentleman's Magazine* (Philadelphia, 1837-1840), by W. E. Burton; the *Dial* (Boston, 1840-1844), edited during its first two years by Margaret Fuller, and afterward by R. W. Emerson, the organ of the school of New England transcendentalists; *Arcturus* (New York, 1840-1842), by C. Mathews and E. A. Duyckinck; the *Magnolia* (Charleston, 1842-1843); the *International Magazine* (New York, 1850-1852), under the editorial charge of R. W. Griswold. Much more prominent and successful than any of these were the *Knickerbocker* (founded by C. F. Hoffman at New York in 1832, and continued chiefly under the editorship of Louis Gaylord Clark till 1860) and *Putnam's Monthly* (New York, 1853-1857, and again 1867-1869). These two were the best of the lighter American magazines of the past.

"The present periodical literature of the United States includes several monthlies of a high class. The *Atlantic Monthly*, founded in Boston in 1857, successively edited by J. R. Lowell, J. T. Fields, and W. D. Howells, and sustained by the frequent contributions of Longfellow, Holmes, Whittier, and other leading writers of America, is prominent among these. *Harper's New Monthly Magazine* (New York, 1850) is the most widely circulated of the American monthlies; and others of a similar class more recently established in New York are *Scribner's Monthly*, edited by J. G. Holland, and the *Galaxy*. *Lippincott's Magazine* (Philadelphia) and the *Old and New* (Boston) are monthly publications of like character. The *Overland Monthly* is published in San Francisco, and the *Lakeside Monthly* at Chicago. All the early magazines drew largely from English sources, but in 1811-1812 appeared at Philadelphia the *Select Views of Literature*, solely devoted to reprints from the foreign periodical press; it has been followed by the *Saturday Magazine* (Philadelphia, 1821); the *Museum of Foreign Literature* (Philadelphia, 1822-1839), the *Select Journal of Foreign Periodical Literature*, edited by A. Norton and C. Folsom, (Boston, 1833-1834), and by two existing publications, *Littell's Living Age* (Boston, 1844), and the *Eclectic Magazine* (New York, 1844). A multitude of magazines filled with light reading, and designed more particularly for circulation among the women of America, has been published, the earliest of which were the *Ladies' Magazine* (Philadelphia, 1799) and the *Ladies' Weekly Miscellany* (New York, 1807-1808); later ones were the *Lowell Offering* (1841), chiefly written by female operatives in the New England factories; the *Ladies' Companion* (New York, 1820-1844); the *Columbian Magazine* (New York, 1844-1848); the *Union Magazine* (New York, 1847), by Mrs. Kirkland, afterward published at Philadelphia as *Sartain's Magazine*; *Arthur's Magazine* (Philadelphia); *Miss Leslie's Magazine* (Philadelphia); and the still issued *Godey's Lady's Book and Peterson's Magazine*, of Philadelphia. Magazines for children appear to have originated with the *Young Misses' Magazine* (Brooklyn, 1806), and have been published since in great numbers. Rather historical than literary have been the *American Register* (Philadelphia, 1806-1810), and periodicals of the same name by Walsh (Philadelphia, 1817), and by Stryker (Philadelphia and New York, 1848-1851), as well as the *American Quarterly Register* (Andover, 1829-1843), by Edwards. The *New England Historical and Genealogical Register* (Boston, 1852), by Drake, and since by John Ward Dean and others, the *Historical Magazine* (New York, 1857), by Folsom, and the *New York Genealogical Record* (1869) are also filled with American historical and biographical matter.

"The review literature of the United States begins with the *American Review of History and Politics* (Philadelphia, 1811-1813), by Walsh; but the ablest and most permanent publication of this sort has been the *North American Review* (Boston, 1815), which has been successively edited by Tudor, E. T. Channing and R. H. Dana, Edward Everett, Sparks, A. H. Everett, Palfrey, Bowen, Peabody, Lowell,

The *New York Weekly*, with which Horace Greeley began his editorial experience, and the *Home Journal*, made famous in its early days by the pens of N. P. Willis and others, are illustrations of a style of publication honestly and thoroughly tried and unmistakably determined not to be profitable. The *Home Journal* has survived from 1849, and is still in a flourishing condition, owing to the fact that its original features have been largely changed and its character assimilated to that of a modern society journal, for which species of publication the American taste seems to offer a more promising field. On the other hand, the success of the *New York Nation*, a journal of high critical and literary ability, proves that a grade of periodical which attains remarkable success in Great Britain is neither unappreciated nor necessarily unremunerative in the United States. Ten years of successful publication by the Boston *Literary World*, and for a shorter period by the *Critic*, of New York, demonstrate that periodicals of criticism and literary intelligence are able to gain a foothold here by virtue of merit, and promise important and valuable additions to our periodical literature as culture becomes more general and the popular intelligence more exacting. While the daily press has temporarily interfered with the success of this class of periodicals by its enterprising intrusion into their field, it is all the while stimulating a public taste which must in time demand and sustain a hebdomadal journalism in this country less crude and less superficial in its judgments. The long list of failures which marks the history of this class of periodical literature in the United States is suggestive of the presence of men among us whose courage and ideals have been ahead of their times.

Charles Eliot Norton, and Henry Adams, and has constantly maintained a high character both for style and critical ability. The *American Quarterly Review* (Philadelphia, 1827-1837); the *Southern Review* (Charleston, 1828-1832), by Elliott and Legaré; the *Western Review* (Cincinnati, 1828-1830), by Flint; the *New York Review* (1837-1842), established by Hawks, and subsequently edited by J. G. Cogswell and C. S. Henry; and the *Southern Quarterly Review* (Charleston, 1842-1852), were well conducted, but were short lived. The *Democratic Review* (New York, 1838-1852), afterward the *United States Review* (1853-1855), and subsequently revived by Florence and Lawrence as the *National Democratic Quarterly Review*; the *American Whig Review* (New York, 1845-1852), by Colton and Whelpley; the *Massachusetts Quarterly Review* (Boston, 1847-1850), by T. Parker; and the *New York Quarterly Review* (1852-1853), were also of short duration. The *New Englander* began at New Haven in 1843, and the *National Quarterly Review* at New York in 1860. The *International Review* was begun at New York in 1874. Minor critical journals have been the *Literary Review* (New York, 1822-1824), followed by Bryant's *New York Review and Athenæum Magazine* (1825), and its successor, the *United States Review and Literary Gazette* (1826-1827); and several periodicals in imitation of the London literary weeklies have been attempted, such as the *New York Literary Gazette* (1834-1835 and 1839); the *Literary World* (New York, 1847-1853), edited by Hoffman and the Duyckincks; *Norton's Literary Gazette* (New York, 1854-1855); the *Criterion* (New York, 1855-1856); the *Round Table* (1865-1868), and the *Citizen* (1864-1873). The *Literary World*, founded in Boston, 1870, by S. R. Crocker, and *Appleton's Journal* (New York, 1869), are successful literary weeklies; the former a critical periodical, the latter general. The *Nation* (New York, 1865), edited by E. L. Godkin, though more properly a weekly newspaper and political review, holds a high place in literary criticism, and has proved successful.

"The periodical religious literature of the country dates from the closing years of the last century. Omitting the notice of weekly journals, only those periodicals can here be mentioned which are of recognized importance in connection with the national theological literature. Of these the following is nearly a complete list: The *Theological Magazine*, bi-monthly (New York, 1796-1798); the *New York Missionary Magazine*, bi-monthly (1800-1803); the *Connecticut Evangelical Magazine* (New Haven, 1800-1814); *Monthly Anthology* (Boston, 1803-1811,) followed in the exposition of Unitarian sentiment by the *General Repository* (1812-1813), the *Christian Disciple* (1813-1819), the *Christian Disciple and Theological Review*, new series (1819-1823), and the *Christian Examiner*, bi-monthly (1823-1870), edited at various times by Palfrey, Jenks, Walker, Greenwood, Ware, Ellis, Putnam, Hedge, and Hale; the *Panoplist*, Boston, commencing in 1805 (edited by Jeremiah Evarts), absorbing in 1809 the *Missionary Magazine*, and about ten years later taking the name of the *Missionary Herald*, which is still issued as the organ of the American Board of Missions, but succeeded as a theological publication by the *Spirit of the Pilgrims* (1828-1833), conducted by E. Pond; the *Christian Magazine* (1807-1811), edited by Dr. John M. Mason; the *Christian Herald* (New York, 1816), transformed in its eighth volume, four years later, into the *Sailors' Magazine*, still published; the *Christian Spectator* (New Haven), *Congregationalist*, issued monthly from 1819 to 1828, and quarterly from 1829 to 1838, and succeeded after an interval of five years by the *New Englander* (1843); the *Christian Advocate*, monthly (Philadelphia, 1822-1834), Presbyterian; the *Princeton Review*, commenced as the *Biblical Repository*, by Hodge, in 1825, in 1871 united with the *Presbyterian Quarterly Review*, when the titles of the two were combined; the *American Biblical Repository* (New York), issued quarterly from 1831 to 1850, when it was united with the *Bibliotheca Sacra* (Andover, 1844), with which the *Christian Review* (Baptist), commenced at Boston in 1836, and afterward published at New York, has been united, and which also in 1871 absorbed the *Theological Repository*; the *American Quarterly Observer* of Edwards (Boston, 1833-1834), united with the *Biblical Universalist Quarterly* (Boston, 1843); the *Literary and Theological Review* (New York 1834-1839); the *Universalist Quarterly Review*, by G. H. Emerson (1844); the *Methodist Quarterly Review* (1841), commenced as the *Methodist Magazine*, 1818; Brownson's *Quarterly Review* (Boston and New York, 1844-1864, revived in 1873), begun as the *Boston Quarterly Review*, 1838; *American Quarterly Church Review* (Episcopal), commenced at New Haven, 1848, and subsequently transferred to New York; *New Englander* (New Haven, 1843); the *Theological and Literary Journal* (New York, 1849-1851), preceded by *Views in Theology*, published in occasional numbers (1824-1833); *Evangelical Quarterly Review*, Lutheran (1850-1870); *Religious Magazine and Monthly Review* (Boston, 1848), transformed in 1875 into the *Unitarian Review*, which is also published monthly at Boston; the *Presbyterian Quarterly* (Philadelphia, 1853-1862), by Wallace, united with the *American Theological Review*, founded by H. B. Smith in 1859, and after the union known as the *American Presbyterian and Theological Review*, till 1871, when, in conjunction with the *Princeton Review*, it took the name of the *Presbyterian Quarterly and Princeton Review*, by which it is now known; the *Free Will Baptist Quarterly* (Dover, New Hampshire, 1853-1866); *Mercersburg Review* (1854), the new series dating from 1867; the *Protestant Episcopal Quarterly Review* (1854); the *New Brunswick Review* (New Brunswick, New Jersey, 1854-1855); *Congregational Quarterly* (Boston, 1859); *Presbyterian Magazine* (Philadelphia, 1851-1860), succeeded after an interval by a similar publication first issued at Cincinnati and subsequently transferred to the *Reformed Church Monthly* (Philadelphia, 1868); the *Southern Review*, commenced in 1867 at Saint Louis under the auspices of the Methodist Church South, and still continued at Baltimore; and the *Quarterly Review of the Evangelical Lutheran church* (1871), succeeding to the *Evangelical Quarterly Review*."

The most notable successes attained by American publications not of a purely news character are found in a type of periodical of which Robert Bonner, of the New York *Ledger*, may be said to have been the fortunate discoverer. Mr. Bonner purchased the *Ledger* in 1851, and shortly thereafter converted it from a commercial sheet, devoted largely to the dry-goods trade, into a family newspaper, excluding from its contents everything relating to the business and news of the day, and substituting therefor a series of continued and short stories, not generally of the highest class of fiction. But he attracted public attention to his venture by engaging the best known literary and public men of the country to write for the *Ledger* over their own signatures. Among the contributors who thus assisted to make the *Ledger* widely known and read were Mrs. Sigourney, Fanny Fern, Edward Everett, William C. Bryant, Horace Greeley, Mrs. Stowe, and Henry Ward Beecher, and under the impetus afforded by these names it rapidly rose to an enormous circulation, which at times has reached as high as 400,000 per issue. The *Ledger* may be said to have been the original of that class of literary publications which has met with the greatest success both in this country and in England. There are in London nearly a dozen publications of this character, none of which, however, are conducted on as high a level as that for which the *Ledger* set a worthy example. These English story papers circulate in enormous quantities all over the kingdom. The imitations of the *Ledger* in the United States have been numerous, and frequently their publication has been attended with great pecuniary success.

The popular story papers.

Mr. Bonner's *Ledger*.

The lapse from a journal of the kind which Mr. Bonner started to the lower grades of sensational reading matter is very easy, and has been found in the United States, as in every other country, one of the most profitable fields of journalism. The country is weekly flooded with poorly printed sheets, whose crowded columns are the receptacle for vilely written stories of exciting adventure and prurient tendency, and whose eager purchasers are the servant girls and the shop boys. Some of these journals hover close upon the borders of decency; and the general effect of this class of periodical literature is far from healthy or advantageous. It has come to have a circulation proportionately larger than that of any other class of journals, although it is still true that periodicals of this kind do not yet meet with the tremendous sale in this country which attends their publication in London.

The sensational press.

It is due to the enterprising publishers of the weekly class of papers to add that there are a number of them, now in a flourishing condition, which are devoted to what is described as family reading, which do possess a healthy moral tone, while they strive to fill their columns with matter which will prove entertaining to all elements in the community. These family story papers are now published in larger or smaller numbers in most of the chief cities of the United States.

Family story papers.

The aggregate circulation per issue of the weekly and monthly periodicals of this class, including all describing themselves as "literary" periodicals, is 1,910,855 copies.

Circulation.

THE RELIGIOUS PRESS.

The next most striking differentiation of the American periodical press suggested by the census inquiry has been the establishment and successful conduct of what is known as the religious press. In 1850 there were 191 religious newspapers and periodicals; in 1860 the number had increased to 277, an increase of 47 per cent. No attempt was made to estimate the circulation of the religious press until the census of 1870, when there were reported 407 religious papers, with an aggregate circulation of 4,764,358. The Tenth Census reveals this number increased to 553, with a correspondingly increased circulation.

Comparative statistics of the religious press.

The religious periodicals of the United States comprise among their number many of our oldest and most successful journalistic enterprises. In tracing the origin of this class of periodicals it is interesting to recall that when Bartholomew Green assumed the management of the original Boston *News-Letter*, in 1723, he gave it a semi-religious character, somewhat in consonance with the prevailing tendencies of public thought at that period and in that section of the country. In his "advertisement from the publisher" he declared "because this is a country that has yet, through the mercy of God, many people in it that have the state of religion in the world very much at heart, and would be glad, if they knew how, to order their prayers and praises to the great God thereon, I shall endeavour now and then to insert an article on the state of religion". Somewhat similar announcements were made by the publishers of other early newspapers. (a)

Over the honor of the establishment of the first religious periodical, distinctively of that character, in the United States there is a long-standing controversy, which this report will not undertake to decide. The Boston *Recorder* was first issued in Boston, January 3, 1816, (b) by Nathaniel Willis, whose father, a practical printer, had printed and published the *Independent Chronicle*, a whig newspaper, in Boston, from 1776 to 1784. The descendants of Sidney Edwards Morse have claimed for him the honor of being its first editor, and in support of this claim they have given what is generally regarded as satisfactory

The first religious journal.

a In 1743 Kneeland and Greene, of Boston, published the *Christian History*, probably the first religious newspaper in the world. It was edited by Thomas Prince, jr.—*His. Mag.*, IX, New Series, 39.

b In February, 1816, Nathan Whiting, of New Haven, Connecticut, issued proposals for a weekly religious newspaper under the title of the *Religious Intelligencer*, in an octavo of 16 pages.—Mansell.

evidence. The *Recorder* now forms a part of the *Congregationalist* of Boston. The *Watchman and Reflector*, a large and well-edited journal, was founded in Boston in 1819 as an organ of the Baptist denomination, and has had from the beginning a prosperous and influential career. In 1820 Sidney Edwards Morse left the office of the *Recorder* and established, in connection with his elder brother, the *Observer*—a journal which has had an equally prosperous career. About the same time were established quite a number of the existing religious journals. The *Zion's Herald*, in Boston, was founded in 1818 as the organ of the Methodist church, and the *Christian Register*, in Boston, in 1821, as an exponent of American Unitarianism.

From the very beginning the men who ventured into the field of religious journalism achieved a degree of success which has not been equaled in any class of periodical publication. This is explainable by the fact that they each had behind them a well-defined and well-organized constituency in the shape of the church whose creed they advocated, and whose membership took pride and found advantage in rendering efficient support. As a rule, they have been conducted with tact, judgment, and business sagacity. The editorial management of the religious journals has generally been consigned to men who are noted in their denomination for efficient services to the church, the publishers early adopting the plan of adding to the popularity of their journals by the introduction of secular departments, in which due attention was paid to the events of the day and to political, social, and material developments of importance.

The honor of serving as the special organ of the large denominations in the United States is now divided between numerous papers, which are generally localized to a degree for the section of the country in which they are published, and which push their respective claims upon the members of their denominations with the business methods which distinguish the purely secular journals. The number of religious journals is thus constantly increasing, and every considerable religious sect in the United States now has its one or more exponents. (a) In this connection a table is submitted (Table X), showing the sectarian division of these papers by states. The following table gives the aggregate number and circulation of all the journals of each of the denominations:

Denominations.	Number.	Circulation.	Denominations.	Number.	Circulation.
Baptist	63	292,428	Presbyterian	42	201,410
Christian	4	7,800	Primitive Christian	2	958
Congregational	14	92,419	Reformed	11	24,230
Disciples	11	56,350	Roman Catholic	70	450,752
Dunkards	4	900	Second Advent	12	51,400
Episcopalian	33	90,030	Spiritualist	7	41,000
Evangelical	27	267,166	Swedenborgian	3	1,600
Friends	5	12,075	Unitarian	4	15,850
Jewish	16	52,500	United Brethren in Christ	7	25,285
Lutheran	22	77,177	Universalist	9	30,300
Mennonite	9	17,425	Unsectarian	96	394,642
Methodist	75	375,461			
Moravian	2	8,500			
Mormon	4	8,200	Sunday-school papers	a 553	2,595,858
				194	b 6,028,049

a 1 Shaker included in total number.

b This includes the issue of enormous numbers of mere leaflets or single-page tracts, for weekly Sunday school use.

One striking peculiarity of the statistics of the religious press illustrated by this table is the large number of journals of a religious character which are undenominational. The success of this class of journals is perhaps the most notable point in connection with religious journalism, and may be taken as a reflex of the habits of religious thought which prevail among the people, and their number has more steadily increased of late years than that of the denominational journals.

In connection with the stability of the religious press, a notable remark was made by the Rev. Clement C. Rabb in closing the sixteenth year of his editorial connection with the *Christian Herald* of Cincinnati. He stated that nearly one-half of the religious papers which were upon the exchange list of that paper in 1852, when his connection with the journal began, had died for want of support during the sixteen years. The statement does not indicate any exceptional lack of vitality in the religious newspaper, while it certainly proves that religious journalism is subjected to precisely the same conditions and risks that surround and embarrass secular journalism. The number of journals of all kinds and descriptions that have been started and have failed in the United States, if it could be accurately ascertained, would be found to be

a There are in Great Britain 400 religious newspapers, 315 of which are printed in London, 26 in Scotland, 9 in Ireland, 19 in Wales, and 31 in English provincial towns. They are representative of all the sects which have any standing in England, the largest number (13) being identified with the church of England. They vary as greatly in size as do those of the United States, and much more in price, running from sixpence to one penny; the better class of them, like the *Guardian* and the *English Churchman*, are six-cent papers. They are uniformly hebdomadal, one or two efforts to establish semi-weekly papers having failed. The oldest English religious newspaper is the *Watchman*, established in 1835 as the recognized organ of the Wesleyan Methodist body, and the *Guardian* (Anglo-Catholic), a sixteen-page paper, quarto, is the most profitable, if not the best edited and managed. It was established in 1846.

many times the number of periodicals now in existence. The blight of insufficient support has fallen with peculiar force upon the more stately periodicals devoted to theological discussion, of which a large number have been inaugurated in the United States and but few have survived for any length of time. The *Bibliotheca Sacra* (founded at Andover in 1844), the *Princeton Review* (originally founded as the *Biblical Repertory*, in 1825), and the *New Englander* (established in New Haven in 1843) are the most notable examples of a long and illustrious existence among American periodicals devoted to polemics. These, with many other religious periodicals which might be named with equal propriety, are striking illustrations of success attained and made possible by the voluntary labors of men who are glad to work for a cause which lies near to their hearts, not only without remuneration, but at a positive sacrifice of money and the labor which represents money.

SUNDAY-SCHOOL AND CHILDREN'S PERIODICALS.

A distinctive feature of American journalism, and one which has been carried farther in this country than in any other, is the periodical adapted to juvenile reading. The first periodical of this class known to have been established in this country was the *Youth's Companion*, established in Boston in 1826 by Nathaniel Willis, the founder of the *Recorder*. This journal is still in existence, and is a handsome, well-printed eight-page weekly. Upon the model thus created innumerable journals have since been founded, and have met with no small degree of success.

Periodicals for the young.

Many of the children's periodicals are Sunday-school papers, and are sold in bulk to the officers of these organizations, instead of to annual subscribers. In this way they reach enormous circulations, and are frequently distributed gratuitously to their young readers. These papers are generally illustrated, with a fair degree of skill, and their contents are graded to the age of the average Sunday-school scholar. The census shows a total of 217 children's periodicals published in the United States in 1880, the greater part of which were of this class of Sunday-school papers. This count also includes a number of leaflets or lesson sheets, issued periodically, and published for the use of scholars and teachers in the Sunday schools of the several denominations.

Sunday-school papers.

In its periodical literature for the young the United States is incomparably superior to any other country on the globe. This class of journals, widely read as it is during the formative period in all sections of the country and by children of every class, grade, and nationality, is an educational influence not surpassed by any other agency at work to effect the elevation of the masses. It is greatly to be regretted that there are included among the children's periodicals a number of prints of the cheaper order, modeled with dangerous closeness upon the flashy, cheap literature for more adult minds, which pours in such an undiminishing stream from the presses of the Anglo-Saxon nations.

A great educator.

Vicious juvenile prints.

In most complete contrast to the journals in question are such juvenile periodicals as the *St. Nicholas*, a monthly founded in 1870, and *Harper's Young People*, a weekly founded in the census year. The former has laid the best brains and the best pencils of the United States under tribute for the edification, amusement, and interest of young people, and it is absolutely unique in its wealth of original illustration and its variety of entertaining reading matter adapted specially to the tastes of the young people.

St. Nicholas and *Harper's Young People*.

THE AGRICULTURAL PRESS.

Continuing to trace the historical differentiation of the American press, the agricultural press next requires attention. The pioneer in this field appeared two years after the first religious journal, and was called the *American Farmer*, issued in April, 1818, in Baltimore, Maryland, and was founded by John S. Skinner, then and still well and honorably known in connection with the discussion of farming topics. The *American Farmer* was for a long time widely circulated throughout most of the states, and is still published.

The first agricultural journal.

The attention of the agricultural classes is taken up by 173 agricultural journals, of all kinds and descriptions, with an aggregate circulation per issue of 1,022,171 copies, this number having increased from 93 in 1870, when their combined circulation was 770,752. The percentage of increase in circulation is quite as great as that of any other variety or class of periodical, a fact somewhat unexpected, inasmuch as the increasing habit of daily and weekly newspapers to devote a considerable portion of their space to the discussion of the freshest agricultural topics—and particularly to those which relate more or less directly to the produce markets—has had a perceptible influence in restricting the circulation of the purely agricultural journal.

Statistics of the agricultural press.

Solomon Southwick established the *Plough-Boy* at Albany in 1821, and Thomas Reen Fessenden and T. W. Shepard founded the *New England Farmer* at Boston in 1822. These were followed by the *Southern Agriculturist*, published in Charleston, South Carolina, in 1828, by John D. Legare, and by the *Genesee Farmer*, published by Luther Tucker in Rochester, New York, in 1830. The latter year witnessed the establishment of the *New York Farmer and Horticultural Repository* by Samuel Fleet. The *Maine Farmer* appeared in 1833; and in 1834 Jesse Buell retired from active political journalism to found the successful *Cultivator* at Rochester. In rapid succession thereafter appeared the *Boston Cultivator*, the *Massachusetts Ploughman*, the *Quarterly Journal of Agriculture*, *Hovey's Magazine of Horticulture*, and the *American Agriculturist*.

Early agricultural papers.

The latter dates from 1842, and is one of the numerous periodicals of the same class which originated in all parts of the country at or about the same time, some of which are still in healthy existence, while others quickly subsided. The *Agriculturist* is especially worthy of mention, because of the remarkable success that has attended the unique and untiring efforts of its proprietor to increase and extend its circulation, which at one time reached a point undoubtedly higher than was ever before attained by a journal of its class. Its contents are duplicated every month for a German edition, which also circulates widely.

These agricultural papers are filled with information and discussion upon all phases of farming, including generally some attention to the produce markets and to family reading matter. Of late years the number of special agricultural journals has been largely on the increase. For instance, the census inquiry reveals a number in different sections of the country devoted exclusively to horticulture or the dairy interest, to stock raising, grape culture, poultry raising, horse breeding, etc., and confined in circulation to subscribers whose attention is occupied with this species of farming. The circulation of these journals is necessarily limited, although many of them have reached a substantial basis, and like all the agricultural journals, they have been of incalculable service to the agricultural interests of the country in the introduction of new and better methods and the general education of the farming classes.

The agricultural journals are generally illustrated, although not in the highest nor always in a creditable style of the art, and are commonly issued once a week, although some of the best known of them are monthly publications. The journals devoted to specialties in agriculture are more apt to be monthly publications. There are several of these journals which are published both in the English and German languages, and half a dozen are exclusively German.

The multiplicity of these journals has prevented any one of them from attaining the large patronage which is enjoyed by several of the leading agricultural papers in Great Britain; and the American journals cannot be claimed to rank with the *Mark Lane Express* and *Agricultural Gazette* of London, either in the fullness or the value of their specially-prepared contents. It is not, however, to be inferred from the superiority of these English agricultural journals that there is any better support accorded to that class of periodicals in Great Britain than in the United States. On the contrary, Mr. John Chalmers Morton, the editor and proprietor of the *Agricultural Gazette*, in a recent appeal for additional subscribers, announced that the enterprise had always been conducted at a loss, and adds that "there is not one of the purely agricultural journals of England which has not for years been spending money unreturned. There is not one of them which is repaying the expenditure upon it". Mr. J. B. Lawes, the eminent agricultural chemist, supplements this statement by the declaration that "the weekly circulation of all the purely agricultural papers published in London does not collectively exceed 10,000 copies". He adds that "the owners of journals devoted to agriculture in the United States count their subscribers by tens of thousands". This latter statement, except in reference to two or three such journals, must be counted an exaggeration.

THE EDUCATIONAL PRESS.

Educational journalism has grown to be a distinctive feature of the American press, the experience of the pioneers in this field having been as precarious, perhaps, as that of any other class of journalists. Most of the 88 educational journals reported are still in their youth, or are founded upon the wrecks of various ill-starred predecessors, and one authority estimates that there have been at least three hundred of these journals which have lived a longer or shorter period since the first was founded.

There are several distinct types of this class of journals. The earliest was the official organ of the state superintendent of public instruction, the first example of which was the *District School Journal*, started March 25, 1840, at Geneva, New York, by Francis Dwight. Mr. Dwight sought to make his periodical the medium of official communication between the superintendent and the district-school officers, as well as to supply other information that would be useful to parents, teachers, and pupils. The *Journal* was subsequently removed to Albany, for the purpose of a closer connection with the state educational authorities, and a law was passed, under which the superintendent applied \$2,800 to pay for eleven thousand *School Journals*, to be sent monthly into every school district in the state. This appropriation was continued for a number of years; and, as the editor once demonstrated, in response to frequent criticisms upon the use of the state funds to keep his periodical alive, it was all that enabled him to pay his printers' bills. In 1852, with volume XII, the *District School Journal* was united with the *New York Journal of Education*, and in the course of the same year it ceased to exist, the legislature of the ensuing winter having declined to make an appropriation for its support.

The *Teachers' Advocate*, founded at Albany in 1845 by T. W. Valantine, was established as the official organ of the State Teachers' Association, and was thus a type of another phase of educational journalism; but its existence was short and uneventful. Some of these official organs, however, have lived long, and have been the means of great good in the advancement of the interests of our system of public education.

Conspicuous among these are the Pennsylvania and the Indiana *School Journals* and the Ohio *Educational Monthly*. The Pennsylvania *School Journal* was established in 1852 and the Indiana *Journal* in 1856, and both were sustained by the state, as proper and necessary adjuncts to the free-school system. The necessity of state support to keep these journals alive can be seen from the figures

given by the same authority in reference to the *Pennsylvania Journal*. Of its twenty-fifth volume it printed 7,500 copies a month; and by the law of the state the school directors are allowed to subscribe for it out of the school fund. Of the 10,810 who might thus subscribe, 1,272 did so, or about 12 per cent. The number of teachers who subscribed was 1,196, or 7 per cent. of those employed in the state schools. The number of copies paid for was therefore 2,468, and the remainder of the 7,500 copies were mailed gratuitously to the secretaries of school boards, superintendents, and others. As an illustration of the difficulties with which the conductors of these educational journals have to contend, these figures are far more creditable to their zeal, enterprise, and disinterestedness than to the intelligence and public spirit of those engaged in the work of instructing our youth. This experience is in marked contrast to that of the *London School Master*, the leading educational journal of Great Britain, whose books are said to contain the names of 25,000 *bona fide* subscribers.

The history of private enterprises in the publication of educational journals antedates that of the official organ, and is no more encouraging. The *Academician*, a semi-weekly octavo, appeared in 1818, at \$3 a year, its editors being Albert Picket, president of the incorporated society of teachers, and his brother, John W. Picket. It lived through twenty-five issues, which were "dry reading". The *American Journal of Education* was founded in Boston in 1826, and was a pretentious publication of sixty-four pages, at \$4 a year. Its conductors announced their endeavor to aid in diffusing enlarged and liberal views of education. It was succeeded, after an unprofitable career, by the *American Annals of Education* in 1830, which lived for ten years longer.

Private ventures in educational journalism.

In 1836 the *Common School Assistant* was established at Albany by J. Orville Taylor, who was well known as an educational leader. He confessed at the end of the second year that his enterprise had never paid expenses, and at the end of the fourth volume he abandoned the undertaking.

Barnard's *American Journal of Education* was founded as a quarterly publication in 1855 by Dr. Henry Barnard and Dr. Abraham Peters, and immediately took rank as the best edited and most valuable of all the ventures of the kind yet seen in this country. It is still published; and in its files may be found some of the best educational literature that has appeared in the United States. (a)

Barnard's *American Journal of Education*.

COLLEGE JOURNALISM.

Closely allied to educational journalism is the college press. In 1800 the precursor of college periodicals was published at Dartmouth college. This diminutive sheet, the *Gazette*, numbered among its contributors Daniel Webster, then an alumnus of some years' standing. Harvard followed in 1810 with the *Lyceum*, to which Edward Everett contributed. In 1827 the *Harvard Register* was started by C. C. Felton. Yale, Williams, Amherst, Hamilton, and other institutions had ventured in the path of journalism before 1835. All of these journals were ephemeral, and compare but poorly with their modern progeny. In 1836 the *Yale Literary Magazine* was founded. The oldest living college periodical, it continues to be in many respects the best.

The first college periodical.

The *Yale Literary Magazine*.

From the humble beginning at Dartmouth, the college press has multiplied, until it now includes 248 periodicals, from which reports were secured for the census. These publications were mostly monthly, but a fair proportion were of weekly or semi-monthly issue, while several appeared quarterly.

The extreme development of college journalism was the appearance of two daily newspapers, edited and published by the students of Yale and Harvard universities. The *Yale Record*, established in 1877, was published every morning, except Sundays and holidays, during the collegiate year, at \$4 a year, or 3 cents per copy; the *Harvard Daily Echo*, established in 1879, was published at noon each week-day during the term, at \$2 40 a year, or 2 cents per single copy. The contents and character of both enterprises are creditable to the enterprise and intelligence of their conductors.

Daily collegiate newspapers.

The printing of the collegiate press is necessarily done by contract in every instance, and for this reason it has been found impossible, and it was not deemed desirable, to include it in the statistics of gross product or wages. The editorial work upon the collegiate press is done by boards of editors, selected generally by vote of the classes, and is proffered without compensation.

In typographical execution equal, if not superior, to the general press of the land, in range of topics wide and attractive, its articles for the most part the fruit of careful reading, earnest thought, and careful revision, the college journal claims notice and praise. The college paper gives to the student a considerable experience in practical journalism, affords an agreeable and profitable recreation, and gives to the world of patrons and friends of education an insight into the actual life of the college—a thing not to be gained from stately annual catalogues. It advertises in a dignified way the institutions represented, submits college sentiments, motives, projects, and deeds to the test of deliberation and thoughtful perusal, and is a power in the college for good. It is, as some one has said, "the outstanding member of the faculty," and fosters acquaintance and community of feeling with sister institutions. In fine, it cannot but be viewed as an important factor in the advance of higher education.

Advantages of college journalism.

^a For most of the data contained in the above account of the educational press of the United States the special agent is indebted to an address on "Educational Journalism", delivered before the New York State Teachers' Association by C. W. Bardeen, editor of the *School Bulletin*, in 1881.

Little or nothing has been done in foreign countries in the field of college journalism. The several universities representing, in their undergraduates, fellows, and faculties, the acme of the national culture, are friendly and helpful to the public press; as is notably the case in Greece. No distinctively undergraduate journal, however, is in existence on the continent, and its publication would be discouraged alike by university and national authorities. In England attempts have been made at the great universities, but the success has been comparatively meager. Canada, on the contrary, bids fair to rival the colleges of the United States in this field. E. R. Gould, editor of the *Acta Victoriana*, furnishes a list of eight journals (three being from female colleges or seminaries), which compare creditably with our own leading college periodicals.

No collegiate journalism in other countries.

Several unsuccessful attempts have been made to establish an intercollegiate periodical, the most promising of which was the *University Quarterly*, otherwise known as the *Undergraduate*. Somewhat pretentious in matter and form, it was for a time very successful, and had it been of longer life would have been an honor to American journalism. It originated at New Haven in 1860, and during the few years of its existence abounded in articles of sterling worth. There is unquestionably a field for a similar journal to-day, and efforts now making may supply the want.

Intercollegiate publications.

In addition to the distinctively college press, there is a large class of publications from the schools and academies, similar in aim and scope to the college journals, but of less frequent issue and more ephemeral in character. When published as often as once a month, school journals have been included among the collegiate journals; but the great majority are annuals, and have not been enumerated.

School journalism.

Slightly connected with this particular differentiation of the American press is amateur journalism, of which there are numerous instances; but they have no special significance beyond the testimony they bear to the increasing tendency of American life to seek expression, in all its phases, through the medium of the printing press.

Amateur journalism.

THE SUNDAY NEWSPAPER.

A phase of journalism which is lately meeting with great success is the Sunday newspaper. The first journal of the kind known to have been established in this country was the *Sunday Courier*, which made its appearance in New York in 1825, and lived but a few months. But the idea appears to have been a taking one among the men who were dabbling in newspaper enterprises, and after a few years various other Sunday papers made their appearance at intervals, the *Atlas*, started in 1837 by three journeymen printers, being the most successful of them. The records contain the names of more than a dozen such papers in New York prior to the war, only a few of which managed to survive the prevailing sentiment against journals of their character and date of issue. Within the last ten years, however, much of the popular prejudice against the Sunday sheet has been overcome; and some of these papers which publish only on Sunday morning are, on their smaller scale, among the most prosperous in the United States.

The first Sunday newspaper.

The investigations of the census revealed the existence, in 1880, of no less than 252 newspapers which are printed on Sunday morning. Nearly half of these, however, were simply regular Sunday editions of the daily newspapers, 113 of which were printed seven days in the week during the census year, or 365 times a year. The habit of printing a Sunday edition in connection with the six issues of the week is of comparatively recent date, and is rapidly increasing in the principal cities of the United States. In all of these cities the time-honored custom of omitting publication on legal holidays is fast lapsing into desuetude, in recognition of the fact that the American people are a nation of newspaper readers, and desire their regular pabulum from the press, without reference to other interruptions in their daily habits of life.

Statistics of Sunday newspapers.

Quite a large number of daily papers, notably those which are published in the southern and far western cities, are in the habit of printing a Sunday morning and omitting the Monday morning edition. This habit is one that originated with the New Orleans *Picayune*. It answers, partly at least, the religious prejudice against the Sunday press—all the work upon which is done on Saturday night or in the early hours of Sunday morning, while the papers published on Monday morning are generally all prepared and put into type during the hours of Sunday.

The prejudice against the Sunday paper, as it first presented itself in New York and other cities, was largely due to the fact that its contents were of a character which religious people regarded as especially unfit for Sabbath-day reading. They were a curious hodge-podge of miscellaneous reading, partly literary, partly political, much given to gossip of the society-newspaper style, and frequently addicted to the effort to increase their circulation by the publication of sensational matter, sometimes of a prurient character.

The prejudice against Sunday newspapers.

The Sunday editions of the regular daily papers are generally made up of a lighter character of reading matter than that which is found in the daily issues, and are especially prepared for acceptable reading in the family circle.

Sunday editions of the daily press.

Sunday journalism has developed in this country to an extent not seen in England or on the continent. May's *Directory* for 1881 gives 10 journals, all published in London, which are recognized as Sunday newspapers, and it adds that, as a matter of fact, there are but two—the *Observer* and the *Sunday Figaro*—published on Sunday alone, the others issuing editions on preceding or following days.

THE PROFESSIONAL AND THE TRADE PRESS.

A thriving class of periodicals is that devoted to the interests of the professional pursuits. There is a great variety of these papers. The professions whose publications have been grouped in this inquiry are those of the law, medicine and surgery, teaching, and science and mechanics; and as no such grouping has been made heretofore in the census, it is impossible to give a statement of the growth of this class of journals during the decade. In 1872 the advertising directories gave the names of 71 periodicals devoted to medicine and surgery; this inquiry reveals a list of 114, with an aggregate circulation per issue of 315,179 copies. There were in the United States 18 medical journals in 1880. Of law journals there were 23 in 1872, and the number in 1880 was 45, with an aggregate circulation per issue of 55,215 copies. England had 21 law journals in 1880.

Statistics of professional periodicals.

Law and medical journals.

Allusion has already been made to the 88 journals devoted to the educational interests, which is exclusive of the 160 school and college periodicals, which do not seem to belong properly to the same class. To science and mechanics the energies of 68 journals were regularly devoted in the census year. From the latter classification the attempt was made to exclude all periodicals which can be more properly described as trade journals, although the distinction was at times a vague one.

The circulation of these journals is of course confined to the members of each profession, and is much more limited than their membership. They have been found invaluable aids to professional study, and their conduct reflects the highest possible credit upon those engaged in the enterprises. The medical and surgical journals of the United States especially rank very high, and are much prized in foreign schools. They keep fully abreast of the latest advances in the several branches of the profession, and their columns have come to be the receptacles for the best work of the most skillful physicians and surgeons. The various branches of the profession are represented by special journals, dentistry, for example, having five periodicals of exceptional value. The *American Journal of Insanity* has been conducted by the physicians in charge of the New York State Lunatic Asylum at Utica, New York, for thirty-six years, and is known as an authority on lunacy practice all over the civilized world; it also ranks as the oldest of existing journals devoted to this subject. The law journals publish promptly and accurately digests of the latest decisions in the courts of all the states, and they have thus become quite as valuable to the profession as the law library.

Importance of the professional press.

The trade press, as may be called, has increased rapidly of late years, and when the census was taken it numbered 248 journals, which were devoted to the interests of one or another of our manufactures. Many of these journals are conducted with marked enterprise and ability, and are among the best specimens of the typographical art which issue from the American press; and there is now no considerable industry in the United States which has not one or more journals devoted to this interest, their attention being largely taken up in the discussion of new processes of manufacture and in careful analyses of the markets. But incidentally they publish much interesting literature, often specially prepared, which bears more or less directly upon the particular industry with which they are associated, or its collateral branches.

The trade press.

ILLUSTRATED NEWSPAPERS.

Illustrated journalism supplies a peculiar and fruitful phase in the history of the newspaper press of all countries. The first attempt in this direction was the famous *Penny Magazine*, founded in London in 1832, which added immensely to its popularity by making a specialty of illustrations. Its wood-cuts were indifferently executed, but they carried the paper even among people who could not read; and the friends of popular education found it one of the best educational agencies England ever had. It was followed by *Punch* in 1841, a periodical based upon the idea that the picture is the natural and realistic complement of linguistic wit and humor. The pictures in *Punch* were for a long time as poor as its wit was trivial; but it gradually drew to its assistance the famous caricaturists and writers of that day, and with the aid of the pencils or the brains of John Leech, Thackeray, Richard Doyle, Mark Lemon, and others *Punch* reached the popularity and success to which both artistic and literary excellence still entitle it. It found a number of imitators, of which *Fun*, *Judy*, and *The Hornet* are the best known.

The first illustrated journal.

The *Illustrated London News* was started in 1843. Its illustrations were cheap and inferior at first; but from the date of the great exhibition, in 1851, they became good specimens of the constant improvement in wood-cut engraving, and the journal itself reaped enormous profits, its circulation on occasions mounting as high as 150,000 per issue. The success of the *Illustrated London News* was well assured before any attempt was made to start a similar publication in the United States.

The Illustrated London News.

The first venture in this direction appeared in Boston, in *Gleason's Pictorial*, by Gleason & Ballou. This journal was shortly removed to New York, where it reappeared in January, 1853, as the *Illustrated News of New York*, published by Barnum & Beach, with Frank Leslie as managing foreman. It lived but one year. After its suspension Frank Leslie established his *Illustrated Newspaper*, which rapidly grew into a profitable undertaking. The first number of *Harper's Weekly, a Journal of Civilization*, appeared January 3, 1857. The few engravings of the first numbers were merely illustrative of the text.

First American illustrated journals.

of fiction and description; but very shortly the events of the day began to be illustrated, and the popularity and success of *Harper's Weekly* were at once assured. The increase both in the number and character of its illustrations has kept pace with the rapid development in the art of wood-cut illustration.

In the meanwhile a great number of illustrated papers of one kind and another had appeared in the American field, most of them, however, like the *Scientific American*, subordinating illustration to text. Illustrated daily journalism. It remained for the proprietors of the New York *Graphic*, in 1873, to discover the possibility of the application of illustration to the immediate news of every day, and they issued the first illustrated daily journal of the world on March 3 of that year. The successful carrying out of this idea was rendered possible by the improvements in the art of photolithographic printing, which permitted

The *Graphic*. the immediate transfer of the artist's work to stone plates, from which it could be printed. There are a number of methods of preparing pictures for presentation, none of which require explanation in this connection. It may be said generally of this photolithographic work that it has the great advantage over the ordinary wood-cut of preserving in detail the exact peculiarities of the artist, and enables a journal like the *Graphic* to reproduce, in admirable manner, perfect fac-similes of the best artistic work at a comparatively slight expense. The *Graphic* shares with the *Illustrated London News* and the Paris *Le Monde Illustré*, *Harper's Weekly*, and the *Illustrated News of New York* the honor of pictorially representing, in spirited illustration, the great events of every continent. In the meanwhile the London *Graphic*, established in 1870, had given a great advance to illustrated journalism by inducing artists and painters of the highest class, who had hitherto held aloof from such work, to contribute directly toward the art education of the people. There are now a number of illustrated journals, both monthly and weekly, which contribute the finest specimens of the pictorial art to current literature.

The use of the illustration has become quite common among the class periodicals of the United States, the census inquiry revealing that there were in 1880 no less than 481 periodicals which were regularly illustrated. The use of illustration in class periodicals. These journals are enumerated, under their proper classification, in Table I. Their popularity and success are both enhanced by the pictorial feature, and the quality of illustration in their columns is steadily improving with the improvements in the processes of producing good illustrations at cheaper rates.

THE FOREIGN PRESS—GERMAN-AMERICAN NEWSPAPERS.

A distinctive peculiarity of the American press, almost unique in this country, is the large number of journals published in the languages of the European countries. In 1872 there were 523 of these journals, and in 1880 the number had risen to 799, which is 7 per cent. of all the periodicals of every kind and description published in the United States. This feature of our newspaper press is so noteworthy that it was deemed proper to prepare special tables (see Tables VIII and IX), in which the various data relating to the foreign papers published in this country are grouped with reference to those of each language, by states and territories. The fifteen languages in which papers are printed, beside the English, were the following, those which have appeared in the press since 1872 being marked with a star (*): German, French, Spanish, *Danish, Swedish, Italian, *Chinese, Norwegian, Bohemian, *Polish, *Dutch, Indian, *Irish, Portuguese, and *Catalan.

This class of journalism is a sure index of the effect of the immense foreign immigration upon our civilization, and may be regarded as indisputable evidence of the superior intelligence of the class of citizens who seek new homes in the United States. The proportion of newspaper readers among them, as judged by the circulation of these papers, is certainly larger than the proportion of newspaper readers among those who remain behind; and when we have regard for the large proportion who are supplied by periodicals published in English, the ratio is indefinitely increased.

The number and success of these journals afford striking testimony to the tenacity with which the foreign-born citizens of the United States stick to the mother tongue in spite of the difficulties and embarrassments its use involves. Another explanation of their success is found in the eagerness of the foreign-born citizen to learn at regular intervals the news from home, which many of these papers make it an especial point to supply in even fuller degree than they do the local news, just as the first colonial newspapers devoted the greater part of their space and effort to the republication of the news from Great Britain.

The number and circulation of the German-American newspapers, as compared to that of the other papers in foreign languages, are out of all proportion to the number of German citizens, as compared either with the French, the Italian, or the Scandinavian. There were, in 1880, 641 German periodicals, of which 80 were daily newspapers, 466 weekly newspapers, and 95 periodicals devoted to specific objects, and published monthly, semi-monthly, etc.

The first German newspaper printed on this continent was published by that eminent pioneer printer, Christopher Souer, or Sauer, at Germantown, Pennsylvania, in 1739. He also printed a German almanac (Thomas, v. 1, p. 272). Another newspaper in the German language was published weekly in Philadelphia as early as May, 1743. Its printer was Joseph Crelus, and its name is understood by Thomas to have been the *High Dutch Pennsylvania Journal*. It existed for several years. In 1748 Godhart

The first German-American newspaper.

An index of the character of immigration.

An unique phase of American journalism.

Armbruster commenced a fortnightly publication in the same place in the German language, which he called *Die Zeitung*, and which was described by an advertisement in the *Pennsylvania Gazette* as "a Dutch and English gazette, containing the freshest advices, foreign and domestick, with other entertaining and useful matters in both languages, adapted to the convenience of such as incline to learn either", printed "at the German printing office, in Arch street; price five shillings per annum". Franklin at one time printed one of these papers.

In 1762 Henry Miller commenced in Philadelphia the publication of *Der Wöchentliche Philadelphische Staatsbote* with German types, which was continued until the British took possession of the city in 1777. Revived again after the evacuation, the journal continued until 1812, when it was finally discontinued altogether.

For a considerable period during its existence there were two English and German papers published contemporaneously every week in Philadelphia—a fact which is chiefly significant as bearing out the ordinary statements regarding the number and the intelligence of the Germans who were among the early settlers in Philadelphia. The original German printing outfit established in the city, like the first press introduced into Boston, was at the expense of a London society, which was formed, in the case of Philadelphia, for the purpose of "promoting religious knowledge among the German emigrants to Pennsylvania". School books and religious tracts in large numbers were printed from this press, and one at least of the German newspapers of which mention has been made was a direct outgrowth from it.

The early German press of Philadelphia.

In 1810 there were eight German newspapers, all weekly, published within the limits of the state of Pennsylvania, and one published in both German and English; but there is no record up to this time of the establishment of any German newspaper in any other state. Of these nine German journals, one only was printed in Philadelphia, two in Lancaster, one in Carlisle, two in Reading, two in Easton, and one in Harrisburg. One of these—the Reading *Adler*—was founded in 1796, and has been in continuous publication ever since. It is now the oldest German newspaper in the United States, and there are but fourteen existing papers which can boast an earlier date of establishment. The next German newspaper in seniority of existence is the Lancaster (Pennsylvania) *Der Volksfreund und Beobachter*, which was founded in 1808, as a federal organ, by William Hamilton & Co.

Statistics of the German press.

In the interval there have grown up in all the large cities German newspaper establishments which are marvels of business thrift and prosperity. In cities like New York, Cincinnati, and Saint Louis the daily German newspapers reach circulations which nearly equal those of the most prosperous English papers, and divide with them the regular advertising patronage. The New York *Staats-Zeitung*, which was founded in 1834 as a weekly paper, became a tri-weekly in 1842 and a daily in 1845, enjoys a daily circulation which is not exceeded by that of more than four of the English metropolitan dailies. It is claimed for the *Staats-Zeitung* that it has the largest circulation of any daily newspaper printed in the German language in the world, none of the papers published in Vienna, Berlin, Cologne, or Frankfort being its peers in this respect, or, it may with truth be added, in other respects. (a) It is edited with the same care, skill, and ability which distinguish its English contemporaries in the metropolis, all of the news of the Associated Press being nightly translated for its columns, and the same spirit of enterprise marked its method of conducting all the departments. One feature of its circulation is unique among metropolitan dailies, all of its issue being taken by the regularly appointed carriers to the residences of subscribers, and its actual subscription list is probably as large as that of any New York daily. In Cincinnati the *Volksblatt*, founded as a weekly in 1836 and as a daily in 1838, stands equally well. In Saint Louis the daily circulation of the German papers is 21 per cent. of the aggregate daily circulation of the city; in New York it is 10 per cent., and in Cincinnati 28 per cent.

The German daily press of the United States.

The New York *Staats-Zeitung*.

In 1850 there were published in the United States 133 German newspapers, which number had been reduced to 76—according to Coggeshall—in 1856. In the latter year there were 26 German dailies in existence, of which four were published in Cincinnati, three each in New York, Philadelphia, Milwaukee, and Saint Louis, two each in Pittsburgh, Baltimore, and New Orleans, and one each in Louisville, Chicago, Belleville, and Newark. There are now 80 German dailies published in thirty-nine cities of the Union; and there is hardly a town of size sufficient to afford good support to a weekly English newspaper, and around which there is a considerable settlement of German population, which does not also support a German weekly. Pennsylvania still holds its own, as it has from the first, as the chief locality for German publications; but of late years the most rapid increase in the German publications has been observable in the larger western cities and in the rural towns of the Northwest.

Growth of the German press in America.

There were published in the United States during the census year 641 periodicals in the German language. Of these, 80 were published daily, 466 weekly, and 95 at all other periods. The aggregate number of copies of the dailies per issue was 447,954; weeklies, 1,326,248; all others, 708,060, and the average subscription price of the dailies was \$7 81, and of the weeklies and all others, \$2 01. The amount paid annually in wages was \$2,398,475 89, an average of \$4,164 03 to each establishment, and the gross value of annual product was \$7,737,299 40. The number of persons employed was 4,064—3,964 males

Present statistics of the German press.

a It has been estimated that from 60,000 to 75,000 of the German-American newspapers are regularly circulated in the German Empire.

and 100 females. The aggregate number of pounds of paper used per issue was 209,146.50, an average of 326.28 pounds to each paper, and the aggregate reams of paper per issue was 5,268.74. The total number of German papers established in the census year was 41; suspended, 33.

The German newspapers have their vicissitudes; and the ratio of suspensions to new establishments is probably somewhat larger than among newspapers printed in English. The great majority of existing German journals of all kinds have been founded within the last twenty-five years, and it was stated by Coggeshall in 1856 that of the 72 German papers he found then existing, only 21 had been in existence for nine years, and 15 of the 21 thus enumerated have since ceased to exist.

Vicissitudes of the German press.

THE FRENCH-AMERICAN PRESS.

The early history of American newspapers published in the French language is necessarily one of isolation, the first venture of this kind of which there is any trace being the *Courrier de Boston*, a weekly newspaper, printed on a sheet of crown quarto by Samuel Hall, in Boston, in April 1789, for J. Nancrede, a Frenchman, who then taught his native language at the university. It was published only six months. (a)

The French press of the United States.

Several newspapers were published in the province of Orleans immediately after its purchase by the United States, a majority of which were either published in French, or in French and English jointly. Of the ten papers which Thomas discovered there in 1810, one tri-weekly was in French, one daily was in English, and one daily was in English and French; and three weeklies were in English and French, with a Spanish weekly and semi-weekly.

New Orleans.

None of the papers enumerated by him are now in existence. In the same year, however, *Le Propagateur Catholique*, a French Catholic journal, was founded, and is still in existence. *L'Abeille*, one of the two prosperous French dailies now in existence there, was founded in 1827. In 1856 there were but four French papers published in the entire country, two of which were in New Orleans, one in New York, and one in Nauvoo, Illinois.

Statistics of the French-American press.

In 1880 there were five French daily newspapers, with an aggregate circulation per issue of 21,500, published one in San Francisco, California, and two each in New Orleans, Louisiana, and New York city. There were 30 weekly French newspapers and 6 French journals of other periods of issue. The aggregate circulation per issue of these 36 periodicals was 54,810. They were located in the following states: California, 4; Illinois, 1; Louisiana, 13; Massachusetts, 4; Michigan, 2; Minnesota, 1; Missouri, 1; New York, 8; Ohio, 1; and Rhode Island, 1. Three of the French publications were founded in the census year, and one of the number suspended. There have been several efforts to establish French weekly newspapers at points in Vermont where irruptions of French Canadians have located. *L'Union Canadienne* was published for a short time at Vergennes, Vermont, and *L'Idée Nouvelle*, with its reading matter in alternate French and English columns, was printed for a short time in Burlington, Vermont, in the interests of Canadian annexation. The *North Star*, at Caribou, in the extreme northern extremity of Maine, surrounded by the French and Swedish settlements, introduced departments in both languages during its brief existence. Journals of this type are not likely to ever prove successful in that part of the United States.

The *Courrier des États-Unis*.

The leading French newspaper of the United States, the *Courrier des États-Unis*, founded March 1, 1828, is now published in New York city every morning, including Sunday, with a weekly edition on Saturday. The idea of its founder was to publish in the states an organ in the French language, and to excite attention to French literature, which at that time was entirely ignored in this country. This idea excluded consideration of politics, commercial interests, news, or international interests; and it is somewhat surprising that the paper should have met with the prompt success that attended it. It was published weekly, in eight quarto pages, at a subscription price of \$8, but in less than two years it became a semi-weekly. In 1839 it became a tri-weekly, and three years later, in May, 1851, the daily editions were commenced. In addition to its regular weekly editions, the *Courrier* publishes a weekly that is especially made up for circulation in Europe, and is largely sent there. The other weekly editions may now be found in the most distant points of the continent wherever French settlements exist of any size, including the Canadas, Louisiana, the Pacific coast, Mexico, the West Indies, and Central and South America.

The *Courrier* owes its remarkable success to the business sagacity and journalistic instincts of Frederic Gaillardet, who took charge of it in 1839. He thus tersely defined his idea of the functions of the journal he sought to make and succeeded in making:

There is a great field to be occupied by a newspaper which can become both the representative and the defender of the French nation in America, which will uphold the traditions of our manners, of our customs, and of our language among the populations of French origin; which can offer itself as a friend and ally to this population in upholding its native idioms and ideas, and in carrying the French diction to all parts of the New World—it will sustain and rally round it all those who speak the language, and of these different scattered members it shall make, if it is possible to do it, one body and one spirit.

The *Courrier* has maintained itself successfully and with great credit ever since, although its circulation has at no time approximated to those which the German dailies of that metropolis have long enjoyed. It is edited

with discretion and ability, and its peculiarity is its adaptation of several of the unique features of the daily journals of Paris, including the printing of a serial story in daily installments. The rival of the *Courrier*, *Le Messenger Franco-Américain*, was established in 1859, and publishes also a weekly, on Sunday, and a semi-weekly, which appears on Sunday and Thursday. It partakes of the characteristics of the *Courrier*.

THE WELSH-AMERICAN PRESS.

The first newspaper in the Welsh language in America made its appearance in the city of New York, as a semi-monthly, in the year 1832. It was called *Cymro America*, and was first printed wholly in the Welsh, then in Welsh and English. It lived less than a year, owing, perhaps, to the panic caused by the cholera. Its editor was J. A. Williams, a printer.

The Welsh periodical press of the United States.

In January, 1838, Rev. William Rowlands, D. D., established the first Welsh monthly in America, *Y Cyfaill o'r Hen Wlad*, in New York city, and except for a few years continued to publish it until his death, in 1866. It was printed for a time in Rome, New York, and Scranton, Pennsylvania, but has been published in Utica, New York, for many years. After Dr. Rowlands' death, the magazine was bought by the Welsh Calvinistic Methodists (whose organ it was), and was for a time edited by Rev. William Roberts, D. D., and Rev. Morgan A. Ellis. Rev. Dr. Roberts, Utica, has been its sole editor for a number of years. It contains forty pages octavo, and of late years has been more strictly religious than before the establishment of weekly Welsh papers.

In 1840 Rev. Robert Everett, D. D., of Steuben, Oneida county, New York, commenced the publication of *Y Cenhadwr* (*The Messenger*) in the interest of the Welsh Congregationalists. It was at first printed in the Utica *Herald* office, and was then removed to the editor's home, in Steuben. After Dr. Everett's death, in 1875, it was published by his son, Lewis Everett, who died in 1881, when the magazine was purchased by Rev. Edward Davies, of Waterville, New York. These two publications have been of great benefit to the Welsh people, though the circulation of neither of them ever reached 2,000. In 1842 Dr. Everett published *Y Dyngarwrr* (*The Philanthropist*), devoted to the anti-slavery cause, but in about two years this was merged in *Y Cenhadwr*. In 1850 and 1851 he also published *Y Detholydd* (*The Eclectic*), consisting of selections from the magazines of Wales.

About 1840 or 1841 a monthly magazine was started in New York city in the interest of the Baptists by Rev. Dr. Phillips. This was called *Y Beread*. It lived less than a year; but in 1842 it was revived in Utica as *Y Seren Orllewinol* (*The Western Star*), under the editorship of Rev. William T. Phillips. It passed into the hands of Rev. Richard Edwards (one of its compositors), who removed it to Pottsville, Pennsylvania, where it was published for many years. Its circulation never reached 1,000, and it finally suspended.

In 1853 John M. Jones established *Y Cylchgrawn Cenedlaethol* (*The National Magazine*), and published it about two years and a half. It was a purely literary journal, consisting largely of selections from Welsh magazines. In 1856 Rev. John Jones published *Y Golygydd* (*The Editor*) in Cincinnati, Ohio, but it lived but a short time. In 1857 Rev. William Roberts, D. D., commenced to republish *Y Traethodydd* (*The Essayist*), a Welsh quarterly review, with American additions. It was issued for about four years. In April, 1876, Rev. O. Griffiths started *Y Wawr* (*The Dawn*) at Utica, where it is still published monthly. In 1848 Evan E. Roberts, of Utica, began to publish *Haul Gomer* (*Gomer's Sun*), a semi-monthly newspaper. It was obliged to suspend in about nine months on account of the difficulty in procuring Welsh compositors. In 1858 *Yr Arweinydd* (*The Leader*), another semi-monthly magazine, was published in Rome, New York, by R. R. Meredith, and continued to appear three or four years. *Y Bardd* (*The Poet*) was published for a few months by Thomas G. Price, in 1858, at Minersville, Pennsylvania, and about the same time a few numbers of *Y Ford Gron* (*The Round Table*) appeared, issued by a company. It did not succeed. *Blodau'r Oes ar Ysgol*, a monthly magazine for children, appeared in 1870, published by Hugh J. Hughes, in New York city. On the death of Mr. Hughes it passed into the hands T. S. Griffiths and W. Apmadoc, Utica, who sold it to Rev. M. A. Ellis, Cincinnati. Shortly after it suspended. R. T. Daniels, Pittsburgh, Pennsylvania, published a small monthly for a short time in 1871. It was called *Y Negesydd*. In the same year, 1871, a company started a small monthly in Hyde Park, Pennsylvania—*Yr Ymwelydd*. It was short-lived.

January 2, 1851, John M. Jones, of New York city, published the first number of *Y Drych* (*The Mirror*), the first weekly Welsh newspaper printed in America. In December, 1854, he sold it to a stock company. In a couple of years it passed into the hands of J. W. Jones, then to J. Mather Jones, and is now owned by Thomas J. Griffiths, who has printed it in Utica for nearly twenty years. Mr. J. W. Jones became one of its editors in its second or third year, and has been its chief editor (except for a short time) ever since. J. C. Roberts has been associated with him for about twelve years. In May, 1855, J. M. Jones commenced to publish *Y Cymro Americaidd* (*The Cambro-American*) in New York, and continued its publication until the war broke out, when it suspended. In the beginning of 1854 a stock company in Utica started *Y Gwyllydd Americanaidd* (*The American Watchman*). It was printed at the office of the Utica *Herald* until 1855, when it was bought by the *Drych* company.

Sketch of the Welsh-American weekly press.

In 1868 a stock company established the *Baner America* in Scranton, Pennsylvania, and published it for several years. It then passed into the hands of Hon. T. J. Phillips, Scranton. It was sold in 1877 to T. J. Griffiths, proprietor of the *Drych*, with which paper it was merged. In 1872 a company commenced the publication of *Y Wasg* (*The*

Press) in Pittsburgh, Pennsylvania, where it is still published. There have been other weekly papers of a political character published for campaign purposes, such as *Seren Oneida*, *Cyfaill yr Undeb*, *Yr Amserau*, in Utica; *Y Gwron Democrataidd*, in New York; and *Tarian y Gweithiwr*, in Scranton, Pennsylvania.

A literary class does not exist among the Welsh people in America; and the contributors to the magazines and newspapers come partly from among the clergy, but more largely from the mechanics and artisans, especially the miners. The contents are largely tinged with theology and theological discussions; but news about the Welsh people in Wales and in America is the main feature. The Welsh journals do not, of course, equal the best English publications; but, considering that they are largely written by men and women of the working classes, and are circulated among such a small constituency, they testify to much mental activity and a high degree of culture among those who labor for daily bread in other than literary pursuits. (a)

In 1880 there were 5 Welsh periodicals, and their aggregate circulation was 19,880. Four of these 5 periodicals were published in the state of New York, and the fifth in the state of Pennsylvania.

THE AMERICAN PRESS IN OTHER LANGUAGES.

There was an Italian newspaper started in New York city in 1854. In 1880 the number had increased to 4, with a circulation of 6,600. Three of these were published in California, and the fourth in New York.

A Norwegian paper was published in Wisconsin as early as 1850. There are now 17 Norwegian periodicals, 1 of which is a daily, published in Chicago; 11 are weeklies, located in the northwestern states of Iowa (6), Illinois (4), Minnesota (3), Wisconsin (1), and Dakota territory (1), and having an aggregate circulation of 44,470.

The Swedish papers, located in the states of California (1), Illinois (10), New York (4), Minnesota (4), Kansas (1), Michigan (1), and Nebraska (1), were, in 1880, 24 in number, 22 of them weekly, with an aggregate circulation per issue of 79,455.

The Spanish papers were 26 in number, 2 of them daily—1 in San Antonio and 1 in San Francisco—and 12 of them weeklies, and together they had a circulation aggregating 66,000. The weekly and other Spanish papers were published in Arizona (1), California (6), Missouri (1), New Mexico (4), New York (9), and Texas (5).

In 1850, when there were but 3 newspapers in San Francisco, 1 was in Spanish.

There were eight Danish papers published in the states of California (1), Illinois (4), Michigan (1), Nebraska (1), and Wisconsin (1), 6 of them weeklies, and all of them combined having a circulation per issue of 3,200 copies.

Nine journals, eight of them weekly, were printed in the Dutch language. These were located in the states of Iowa (2), Michigan (6), and Wisconsin (1), and their united circulation per issue was 11,000.

The Bohemian-speaking population of the United States is noticeably successful in sustaining periodicals, there being, in 1880, 13 printed in this language, 2 of them daily—1 each in New York and Chicago—and 11 of them weekly, with a circulation of 25,150. The 11 weeklies were located in the states of Illinois (3), Iowa (1), Nebraska (1), New York (2), Ohio (1), Texas (1), and Wisconsin (2).

The Polish and Portuguese papers were two each, with aggregate circulations of 5,000 and 10,000, respectively. There was one paper each in Catalan and in Irish printed in New York city.

Among the curiosities of the American press are the two newspapers published in San Francisco, California, in the Chinese language. These papers are as widely different from anything else published in this country as it is possible to be. *The Oriental* (*Wah Kee*) was established in 1875 by Yee Jenn, who learned the job-printing business subsequent to his arrival in this country, one year previously. He makes use of about 7,000 of the Chinese characters; and, as he has never been able to import Chinese type to this country, all the characters in the paper are formed by hand with a peculiar ink. The sheet, when thus prepared, is impressed upon a smooth stone, over which is constructed a crude machine answering for a press. Upon the stone as thus impressed each separate sheet of the edition is placed, subjected to pressure, and when removed is found to be printed with duplicate characters. The process is one of primitive lithography. When the edition is worked, the stone is chemically cleaned for the next paper. The contents of *Wah Kee* consist of advertisements, some San Francisco local news, and extracts and news from the Chinese press. It is sold at 10 cents a copy, or \$5 a year, and claims a circulation of 1,000 copies, many of which are sent to China. The second Chinese paper, "The Chinese-English newspaper" (*Tong Fan San Bo*), was established a year later, is very similar in contents and appearance, and is prepared and printed in the same manner. It claims a circulation of 750, which is said to be regularly increasing. It is sold at the same price. Both these Chinese journals are weekly. (b)

a The special agent is indebted to Mr. Benjamin F. Lewis, of Utica, New York, for the historical data of the Welsh-American press.
b A Chinese newspaper was first established in San Francisco in 1853.—Rev. Henry Cotton.

Two Indian journals, two of them weekly, are printed in the Indian territory, one of them half in English and half in Cherokee.

The full details of these foreign papers will be found in Tables IX and XIV.

The location of this foreign American press is worth attention, as indicating with much the same fidelity as the census tables of nativity the states in which the larger colonies of the several nationalities of our foreign-born citizens are located.

The difference between the population of the United States and that of Great Britain is well illustrated by the difference in the statistics of the foreign press of the two countries. Contrasted with the figures above given, there were in Great Britain in 1880 but 23 journals published in all languages other than the English. Of these, six were published in the French language, including three in the Channel Islands, and but three in the German language. There was one paper printed in the Italian language, and one was published in English, French, Portuguese, and Spanish combined. One paper was printed partly in Gaelic, and eleven were in Welsh. With the exception of an occasional English newspaper, published for the benefit of the English-speaking travelers, there are few journals on the continent of Europe in a language other than that indigenous to the country. The French newspapers printed in several European cities hardly form an exception to this rule, as they are read by the native population.

THE NOMENCLATURE OF AMERICAN NEWSPAPERS.

The nomenclature of the American press presents a curious study, and during the colonial period there was little disposition to seek for diversity of title. In nearly every colony the first newspaper established was a *Gazette*, as has been seen; and until after the revolution that name was as frequent as all others combined. Of the thirty-seven newspapers in existence in 1775, sixteen were *Gazettes*. The second name most frequent of adoption was the *Mercury*, adapted from the *Mercurie* of the Elizabethan era in England. Then followed, in order, the *Journal*, *Post-Boy*, *Packet*, *Courant*, *Post*, and *Herald*—names obviously suggested by the functions of the newspaper or typical of the methods of its delivery. The changed conditions that surrounded American journalism immediately following the revolution were immediately illustrated in the rapid variations in newspaper nomenclature. The intimate relations of the press to political parties was proclaimed in the new titles which made their appearance, and the *Democrat*, the *Republican*, the *Whig*, the *Constitutionalist*, the *Patriot*, the *Federalist*, the *Palladium*, the *American*, and titles of similar significance, became the predominating ones. The name *Advertiser* began also to appear frequently during this period, generally as a secondary caption, in recognition of the growing importance of the periodical press as a medium of business communication between the individuals of a community. As early as 1812, as may be seen from the list of the newspapers of that day elsewhere published, the tendency toward unique and fantastic newspaper titles was well developed. This tendency has continued ever since, particularly in the more recently settled sections of the United States, where it has not only become excessive to a degree unknown in other countries, but has been carried to extremes bordering on the absurd.

UNITED STATES vs. ENGLISH JOURNALISM.

It is difficult to institute a rigid comparison between the press of the United States and that of other countries, because the conditions of existence are totally unlike. In general development the periodical literature of the United States and that of Great Britain present many points in common, and there has been in both countries, progressing simultaneously, the same remarkable development of the special or technical press. The regard for the interests of particular trades, professions, and fields of inquiry has stimulated the printing presses of both countries to a degree seen nowhere else, and may perhaps be ascribed to the popularization of the higher lines of thought and intelligence. In what may be called its abstruse press, Germany is superior to either the United States or England, and France is not behind them; but the journals of which we are speaking are of the kind which are fitted to the wants of the many rather than to the few, and in the effort to lift the former up to a higher grade the special press of the United States may take an undoubted precedence of that of England.

Unique conditions of journalism in the United States.

The periodical press of England and the United States contrasted.

This tendency is, if anything, carried to too great an extreme in the United States—a fact clearly ascribable to the greater and closer competition here, and the consequent disposition to resort to literary and typographical devices for securing the patronage which others possess and endeavor to retain. There are fewer of this class of journals, in proportion to the population superficially interested in them, in England than in the United States. This is due to the more gradual English development of this class of periodical literature—a development which was well under way while the ordinary newspaper press was getting its first foothold in the United States.

England, however, has not been free from the influences of artificial stimulus in her press history. In 1846, when the railroad mania was at its height in Great Britain, there were no fewer than eighteen journals, some of them of diurnal issue, which sprang into existence, made money while the excitement lasted, and disappeared with the collapse of the bubble. In 1851 only three of these periodicals survived, and at present, notwithstanding the

great and healthy growth of the English railroad system, there are but four journals published in the interest of railroads, beside two which are devoted to the cause of railway employés. We have in the United States as many strong and well-sustained newspaper establishments as has Great Britain; but we have an infinitely larger number that are weak and even ephemeral, like the English railway periodicals of 1846.

The tendency in England is toward the consolidation of popular support around the journalistic establishments which have long existed and are able to be liberally conducted. Such has not been the tendency in the United States, certainly not until within a few years, and then only with respect to a class of newspapers like the metropolitan press. That such will be the tendency ultimately we are led to believe, not only by the experience of English journalism, but by the obvious drift already apparent here, and by a firm conviction of what is best and natural in the premises.

It is natural, under the circumstances, that in typographical characteristics the special or class journals of Great Britain should, as a rule, be far superior to those of the United States. The art of printing has reached such great perfection in both countries that to command its best results requires only the command of the means. Many of the technical journals of this country are execrably printed, because the use of modern type, good paper, and improved machinery is not warranted by the receipts. In the struggle for existence the American journals permit their columns to be disfigured by venturesome advertisers, who will pay for monstrosities of type or wood-cut to attract attention, and will pay for nothing else. These things are inevitable until such time as publishers shall be able to dictate terms to their advertising patrons, instead of accepting dictation from them.

The quality of paper used in England is, as a rule, better than that which is commonly employed here. It is better, not because it is more easily obtainable, but because more money is paid for it. The imprint is generally clearer, partly because of the better quality of the paper and partly because of the greater care and expense bestowed upon the press-work. The display of advertisements is almost uniformly in better taste, in better classification, and with greater regard for the requirements of typographical beauty.

While all this must be said by way of a general comparison of the typography of English and American periodicals, it is still true that we have individual publications in the United States, in goodly numbers, which are typographically equal to anything done in England or on the continent. In every large American city there are journals which present regularly an appearance which is creditable to the art in its best development. This is becoming strikingly true in the case of our metropolitan dailies and their auxiliary issues.

The contrast between the daily journalism of Great Britain and that of the United States is different, yet it is quite as marked. The London and the New York daily newspaper display an equal amount of enterprise in the collection of the news of the world, but it is exerted in different ways, and its results are spread before the people in accordance with different notions of what is the most effective. The London journal is regarded by the average American as heavy and stupid; while the average Englishman is apt to look upon the American daily as altogether too frothy and superficial to be profitable reading. It has for many years been the custom in London to employ the best attainable literary ability in constant editorial writing, as well as in continental and other correspondence. More and more every year the American journals of the metropolitan and large provincial cities tend in the same direction, and the American editor now enjoys a salary which will average as high as that of any other professional man. (a) But the mark of scholarship and of painstaking work is not as discernible in the editorial writing of the daily press of this country, nor is there, perhaps, the same opportunity for its display. The erudite disquisition which is of daily appearance in the British press is displaced in American newspapers by a far wider variety of information and a far more miscellaneous collocation of reading matter. The intimate relations of Great Britain with continental politics led the chief daily journals many years since to the establishment of expensive and ably equipped bureaus in the European capitals, whose special telegrams fill column after column of reading space, to the exclusion of a large portion of that more miscellaneous reading matter which the American newspaper supplies in such a bountiful manner.

This is displaced in American journals by a multiplicity of news items, telegraphic and otherwise, in which are mirrored every day the multiform if somewhat monotonous life of fifty millions of people, living at peace with each other and working out a civilization as varied as it is extensive. The American press uniformly publishes more news, even though it is not better, than its

^a It may be doubted whether the general staff of a London newspaper, with perhaps the single exception of the *Times*, is better paid than a staff of corresponding numbers in New York. A few writers here and there may receive a higher rate of remuneration, but put all expenses together, and the New York paper will be found to cost the most in its production. Reporters in London receive from £2 to £4 a week. Men could not be got to do the same kind of work here for a corresponding price. The New York dailies pay more for editorial articles than their London contemporaries, always excluding one paper from the comparison. * Again, the chief editors in this country are generally in part proprietors, and have their shares given to them, or at least acquire them on easy terms.—L. J. Jennings, in *Galaxy*, volume IX, No. 4.

Mr. James Grant, in 1872, in making a comparison between the salaries paid to editors in the three cities of New York, London, and Paris, concluded that those of the former city were on the whole the highest.

English contemporaries. In its general features it is a journal for the masses, which can be said of no prominent English daily. It consults all tastes, all pursuits, all grades of the community, and the undeviating tendency of its development has been toward popularization. Sensationalism is the inevitable accompaniment of this tendency, and American newspapers draw much of their vitality from it. But at the same time they are, as a rule, the conservators of law, of morals, and of patriotism, and strive more directly and successfully than English newspapers to enlarge their field of usefulness by the completeness of their records and the accuracy and comprehensiveness of their contents. Their general characteristics are not unlike those of the people for whom and to whom they speak, and their rapid and encouraging improvement from year to year in every department of newspaper growth is one of the marked signs of the times. (a)

The marked difference in the development of the periodical press of the two countries is largely due to the difference of governmental conditions. Since the revolution, with the single exception of a five years' income tax on advertisements from 1863 to 1867, the press of the United States has been absolutely free from government tax of every kind or description. It has had the added advantage during a great portion of the century of the use of the mails without prepayment of postage, and always the advantage of much cheaper rates of postage than have prevailed either in Great Britain or on the continent. In England, on the other hand, the government laid heavy and various imposts upon the newspaper, the last of which has only been removed since 1864. The taxes were threefold—the advertisement duty, the stamp duty, and the paper duty; and until within a few years after the passage of the reform bill of 1832 there had been for more than thirty years a 4*d.* stamp on all newspapers, 3*s.* 6*d.* duty on every advertisement, and 3*d.* per pound weight on newspapers. The price of a newspaper was then 7*d.*, and the smallest advertisement cost 7*s.*

English newspaper taxes.

The effect of these high prices, necessitated by government tax, was to keep the British press in a condition which practically forbade progress. At the time when this stamp duty was reduced, in 1836, from 4*d.* to 1*d.*, the newspaper press of the United States had already surpassed that of Great Britain in number, while its aggregate annual circulation was nearly double that of the British press, although the population of the United States, by the census of 1830, was but 12,866,020, that of Great Britain being then 24,392,485.

Reduction of the stamp duty in 1836.

The taxes on newspapers continuing onerous, there occurred in Great Britain about 1850 a concerted and widely organized movement for relief, which resulted, in 1853, in the repeal of the duty on advertisements, and two years later (1855) the agitation led to the abolition of the penny stamp on newspapers. There then remained only the tax of three half-pence per pound on paper, a tax which bore heavily upon literature and publishing in all their diversified departments. This duty remained unrepealed until 1861. The effect of this repeal in stimulating publication and increasing circulation may be gathered from the fact that the remission of the duty reduced the average cost of paper twenty-five per cent., and it averted the suspension of many provincial and local metropolitan journals, which had in many cases been passing through a losing struggle for existence. (b)

Repeal of the English duty on advertisements and the tax on paper.

Something of the effect of this final freedom from all tax upon the circulation of English newspapers was depicted by Edward Baines, member of parliament from Leeds, in a speech made by him in 1864 for the limited extension of the political franchise in parliamentary boroughs. He quoted a number of specially-prepared statistics, which went to show that in 1831, when the stamp on newspapers was 4*d.*, and the duty on paper 3*d.* per pound weight, the total yearly circulation of newspapers for the United Kingdom was 38,648,314. In the year 1864, in which Mr. Baines spoke, the annual aggregate circulation of London newspapers alone was 205,462,400, while the total yearly circulation of newspapers in the United Kingdom was 546,059,400. Recalling the fact that this increase in circulation was accompanied by an increase in population of only 30 per cent., it presents a phenomenon that not even the astonishing growth of the press in the United States surpasses. (c)

Effects of the repeal of taxes on the English press.

a The result of leaving newspapers to manage themselves in the United States is, that they are, as a rule, more enterprising than English newspapers. More money, for instance, is here spent in a single day for news than a London daily would spend in a week, and it is nothing unusual to see a whole page of telegraphic news in a New York morning newspaper. Atlantic cable messages of a column or two in length are as common as a police report. When a message of the same kind appeared lately in a London paper, people were struck with amazement, and the rest of the journals prostrated themselves in dust and ashes. From three to five columns of congressional debates are telegraphed to New York every night during the session. In the midst of the Abyssinian war the English papers were not above accepting some important telegraphic news concerning the British army from the correspondent of the New York *Herald*.—L. J. Jennings in the *Galaxy*, 1870.

b Grant, *Newspaper Press*, vol. II, p. 317.

c The rapid development of the newspaper press of the United States has been an unfailing topic of comment in Great Britain. In his *History of Advertising*, published in 1874, Mr. Henry Sampson declares:

It is almost impossible to tell the number of papers published throughout the United States of America, each individual state being hardly aware of the quantity it contains, or how many have been born and died within the current twelve months. The Americans are truly a great people, but they have not yet settled down into a regular system, so far, at all events, as newspapers and advertisements are concerned.

Mr. Sampson adds that "a professed and apparently competent critic" assures him that "there are quite 3,000 newspapers now (1874) in the states, and that at least a tithe of them are dailies". As a matter of fact, there were in that year 7,339 periodicals published in the United States, of which 678 were daily journals.

Nevertheless, in point of numbers, the growth of the provincial press of Great Britain has been comparatively slow, even since the removal of all these burdensome taxes upon knowledge. (a) It is within the scope of this inquiry to make a comparison of the newspaper press of Great Britain with that of the United States. In May's *English Press Directory* for 1881 the total number of publications of all kinds printed in the United Kingdom is placed at 2,997, of which 2,076 were political newspapers and 921 were periodical journals of class characteristics. The political newspapers were classified as follows, by periods of issue, and among the geographical divisions of the British isles:

When published.	Number of newspapers published in—						Total.
	Metropolis.	England.	Wales.	Scotland.	Ireland.	British isles.	
Daily, morning	14	45	3	12	13	1	88
Daily, evening	14	48	1	10	5		78
Five times a week	2	10					12
Three times a week	7	9		1	8	3	28
Twice a week	11	70	2	12	23	5	123
Weekly	361	893	58	141	108	9	1,570
Twice a month	12				1		13
Fortnightly	14	1		1			16
Monthly	104	15		5	5		129
Quarterly	2						2
Irregular and miscellaneous	8	7	1	1			17
Total	549	1,098	65	183	163	18	2,076

The periodical publications were similarly classified, as follows:

When published.	Number of periodicals published in—						Total.
	Metropolis.	England.	Wales.	Scotland.	Ireland.	British isles.	
Daily	3	1			2		6
Three times a week				1			1
Weekly	61	14	1	6	4		86
Fortnightly	8	2					10
Monthly	464	92	22	33	15	1	627
Bi-monthly	7			1			8
Quarterly	108	13	1	2	3		127
Half-yearly	9						9
Irregular and various	36	10		1			47
Total	696	132	24	44	24	1	921

The English directories differ as widely as the American in their statements of the statistics of the newspaper and periodical press. Mitchell's *Directory* for the same year places the number of newspapers in the United Kingdom at 1,886, divided as follows: Metropolis, 378; England, 1,087; Wales, 66; Scotland, 181; Ireland, 154; British isles, 20; the number of periodicals at 1,097; total, 3,083, as against 2,997 reported by May's *Directory*. These discrepancies, like those which occur in the reports of the American press, are doubtless due to the adoption of different rules to determine what publications shall be regarded as newspapers or periodicals, and what shall be thrown out as mere advertising devices.

Comparing the statistics here given with those contained in the tables submitted with this report, we find that the United States, with a population of 50,155,783, had 971 daily papers, which was 1 to each 51,654 of population, while Great Britain, with a population of 35,246,562 in 1881, (b) had 172 daily papers, which was one to each 204,922 of population. This extraordinary difference is somewhat reduced by taking England alone; 125 of the 172 daily papers embraced in the above comparison having been published in that portion of Great Britain the population of which is reported at 20,793,820, which is an average of one daily journal to each 166,351 of population. Recalling the fact that England is far better supplied with daily newspapers than any other country in the world, except the United States, and especially regarding the compactness of its population, and the correspondingly greater facilities for quick and easy circulation, the unique standing of our own diurnal journalism is made evident by these comparisons.

Carrying the same analysis farther, we find in Scotland, with a population of 3,734,370, 22 dailies, which is one to every 169,744 of population.

a Mr. James Grant asserts this to be the fact also with reference to the daily metropolitan press. "It was the general belief," he writes, "that when the stamp duty of a penny on newspapers was reduced to a half-penny as regards the postal transmission of journals we should at least have some addition to the number of our daily journals. But not one single daily paper, morning or evening, has been added to our previously existing list (1872). Nor, considering that no new morning newspapers could have the shadow of a chance of success without an expenditure of at least £50,000, is there any probability that we shall, for many years to come, see any additions to the present six morning journals."—*The Newspaper Press*, vol. II, p. 406.

b I have used the preliminary figures of the recent census of Great Britain.

In Wales we find 4 dailies and 1,359,895 population, or one daily to each 339,974 people.

There were 20 dailies published in Ireland, with its population of 5,159,839, which is one daily to each 257,992 of population.

Contrasting these figures with those of individual states in the United States, we may arrive at a closer comparison. The population of New York state is but 76,968 less than that of Ireland; and New York supports a daily newspaper to every 44,199 of population.

There were only three states in the Union where the number of daily papers was so small, in comparison with population, as in England itself. These were the states of Mississippi, where one paper was printed to each 226,319 of population; West Virginia, with one daily to each 309,228 of population; and Alabama, with one daily to each 210,417 of population. Arkansas, which had but six daily papers and a population of 802,525, averaged one daily to each 133,754 of population, which is 33,000 less than the average for England. The illiteracy statistics of these southern states are to be taken into account in estimating the significance of these comparisons. On the other hand, the variations in the circulation of the daily papers printed enter into the calculation as a modifying element. This fact is best proved by the case of Nevada, which, with a population of 62,266, supported no less than 14 daily papers in the census year, or one to every 4,448 of population, while the total circulation of the Nevada dailies was but 17,155.

We have seen that the average population of the cities in the United States which support one or more daily newspapers is 32,374, and that, as a rule, a population of 10,000 or under is sufficient to support a daily. England presents an extraordinary contrast to this rule in the United States. City after city, with a population far exceeding these figures, remains to-day without daily publications of any kind. The following list contains the names of the principal English towns with a population of 20,000 or over which had no daily paper in 1880. The population statistics are as estimated by May, from whose directory the list is compiled, the number of weekly, semi-weekly, and tri-weekly papers being added in the case of each town:

Town.	County.	Population.	Papers.			Town.	County.	Population.	Papers.		
			W.	S. W.	T. W.				W.	S. W.	T. W.
Aldershot	Hants	30,000	4			Kighley	York	29,000	2		
Bacup	Lancaster	29,000	2			Kidderminster	Worcester	22,330	3		
Barnsley	York	29,021	3			Kingston	Surrey	30,000	1		
Barrow-in-Furness	Lancaster	40,000	2	2		Leamington	Warwick	22,000	4		
Batley	York	28,071	2			Leigh	Lancaster	33,592	2		
Bilston	Stafford	24,188	1			Lincoln	Lincoln	40,000	1	1	
Birkenhead	Cheshire	80,000	1	1		Luton	Bedford	22,000	2		
Burnley	Lancaster	40,858	2			Macclesfield	Cheshire	35,450	2	1	
Burton-on-Trent	Stafford	35,000	2	1		Maidstone	Kent	30,000	2	4	1
Cambridge	Cambridge	30,078	3			Middleton	Lancaster	20,000	1		
Canterbury	Kent	20,962	6			Pendleton	Lancaster	50,000	3		
Carlisle	Cumberland	31,049	2	1		Reading	Berks	32,324	3	1	
Chatham	Kent	45,792	2			Rochdale	Lancaster	70,000	2		
Chester	Cheshire	35,257	2	2		Rotherham	York	35,000	2		
Colchester	Essex	26,343	3	3		Saint Helens	Lancaster	57,000	4	1	
Coventry	Warwick	37,670	3	1		Salford	Lancaster	170,000	2		
Crewe	Cheshire	24,300	2			Shipley	York	25,000	1		
Darwen	Lancaster	30,000	1			Shrewsbury	Salop	23,406	3		
Devonport	Devon	49,449	2			Southampton	Hants	70,000	4	1	
Dudley	Worcester	43,782	2			Southport	Lancaster	32,000	1		1
Enfield	Middlesex	20,100	1			Stalybridge	Lancaster	21,092	2		
Farmworth	Lancaster	24,000	1			Stockport	Cheshire	53,014	3		
Gateshead	Durham	48,627	1			Stockton-on-Tees	Durham	37,612	2		
Gorton	York	21,616	1			Torquay	Devon	26,000	2		
Gravesend	Kent	21,265	5			Warrenton	Lancaster	32,144	2	1	
Halifax	York	71,000	3			Wednesbury	Stafford	25,030	2		
Heywood	Lancaster	22,000	2			West Bromwich	Stafford	47,918	1	1	
Hyde	Cheshire	30,000	2			Wigan	Lancaster	45,000		1	1

Many of the above-enumerated towns are market towns or the centers of large manufacturing and agricultural interests. We have seen that the whole United States, with its population of 50,155,783, will not furnish one-third as many towns with equal population without from one to five daily papers published in each. The great number of large towns without daily newspapers explains the large ratio of population to each paper published in England.

To further emphasize the contrast, it may be added that the smallest English town in which a daily paper is published is Grimsby, in Lincolnshire, with a population of about 30,000. Many of the largest provincial cities, like Hull, population 143,000, and Leicester, population 130,000, were satisfied with two dailies. Manchester, population 400,000, had six dailies, and Liverpool, population 527,083, had eight, which is a smaller number than the cities of equal size in the United States sustain.

The marked contrast between the press of the United States and that of Great Britain is the larger average circulations which obtain in the latter country—the natural consequence of the fewer number of papers published in proportion to population and their greater stability. (a)

THE CIRCULATION OF NEWSPAPERS IN NEW YORK, LONDON, AND PARIS.

We have long been accustomed to the fact that the people of the United States are the greatest readers of newspapers in the world. The data regarding the press in other countries are not sufficiently complete to permit of an actual demonstration by comparative figures; but the general statement of the number of newspapers published in proportion to population, as given above, is sufficiently conclusive as to the general fact.

Americans the greatest newspaper readers in the world.

The circulation of the daily newspapers in the three cities of New York, London, and Paris affords something of a basis upon which to reach a right conclusion in the matter.

The daily press of New York, London, and Paris.

The Tenth Census shows twenty-nine daily journals published in the city of New York, with an aggregate daily circulation of 765,843, the population of the city at the same time being 1,206,299.

There were in the same year twenty-eight daily journals of all kinds published in the city of London, with its enormous population of 3,254,260 in 1871. The best attainable information as to the circulation of these journals places the aggregate at 710,000, or less than the aggregate circulation of the New York journals.

It has been found impossible to obtain reliable information as to either the number or the circulation of the Paris daily journals. The number is much larger than that of either New York or London, and several of them have enormous circulations. New ventures in journalism are so constantly appearing and disappearing in the French capital that a statement which is good for one year is worthless for the next. French authorities have estimated recently that the combined circulation of all these dailies is in the neighborhood of half a million copies, although statements placing it much higher are of frequent appearance.

The circulation of the Paris journals is very largely confined to the environs of the city itself, while the issues of the daily press of London and New York, in about the same relative ratio, are largely sent into the provinces and the states. The figures given for the daily circulation of the papers published in these cities do not therefore represent the actual number of those who buy a daily paper in either metropolis. On the other hand, it is safe to calculate that every printed paper thus circulated is read by at least two persons, some estimates doubling the average number of readers to a copy. Even at this low estimate the figures given supply, after making due allowance for the editions sent out of the city, a daily newspaper to every man, woman, and child in New York city.

Ratio of circulation to population in the three cities.

The same method of reaching a conclusion will assign a daily newspaper to one in every three of the population of London and one in every two of the population of Paris. The proportion of readers to population in London and Paris is much larger than in any other portions of either country, while in New York city the proportion is not as large as this inquiry has revealed it to be in several other American cities.

There are single journals, both in London and Paris, which reach a much larger circulation than any single journal in the United States. Since the abolition of the stamp duty there has been no authentic method of reaching the actual circulation of the London dailies, but the shrewd estimates made are undoubtedly not many thousand copies out of the way. The stamp returns show that the London *Times* increased in circulation as follows: 1834, 10,000; 1844,

Circulation of London and Paris daily newspapers.

a Mr. H. P. Hubbard, in his *Newspaper Directory of the World* (1881), gives some interesting comparisons regarding the comparative circulation of English and American newspapers, as follows:

"Eight thousand two hundred and eleven newspapers and magazines published in the United States and Canada, whose circulation is given, emit an aggregate per single issue of 20,677,538 copies. The average circulation of each journal is 2,041, against an average circulation of 7,602 of each British publication, thus showing that the average American journal has but 27 per cent. of the circulation of the average British.

"The aggregate of all issues for one year from the 8,211 American presses mentioned is 1,836,473,592 copies, against 1,734,841,956 copies, issued by the 2,928 British presses. Thus it will be seen that our foreign cousins, with but little more than one-third the number of American publications whose circulation is known, send out within one-eighteenth of as many copies per annum as ours. This may at first seem incredible when we consider that the population of the entire United Kingdom does not exceed 35,000,000, while that of the United States and Canada varies but little from 54,000,000. There are, however, in the United States and Canada, in round numbers, 2,000 publications whose circulations are not included in the American lists. Estimating their average issues per press at the same as those given, these 2,000 presses would add to the annual American issues 459,118,398 copies, giving to America for its 54,000,000 people an aggregate of 2,295,591,990 newspapers and other periodicals per annum, or at the rate of 42 $\frac{5}{100}$ copies per annum for each individual. The British press, issuing 1,734,841,956 copies for 35,000,000 people, furnishes to each individual within the kingdom 49 $\frac{5}{100}$ copies per annum, showing that were the circulation of the British press confined wholly to its immediate kingdom the average Briton would intellectually devour seven more periodicals in the course of a year than the average American and Canadian. It should not be forgotten, however, that the press of Great Britain enjoys an extensive field of circulation among the inhabitants of its numerous colonies—in Australia, South Africa, India, and even in Canada—to which the American press has no parallel. Subtracting, therefore, from the total circulation of the press of the United Kingdom that which seeks the colonies, it is fair to infer that the remainder does not exceed, per capita, the number supplied by the American press to its own readers."

23,000; 1854, 51,650. During the Crimean war the figures reached 70,000, and remained stationary for several years at that figure, with a tendency to decline under the pressure of the excellent penny papers which had then recently sprung into existence. The present circulation of the *Times* is believed to be about 60,000, while the London *Daily Telegraph* makes a claim, not generally disputed, to a circulation of 150,000,^(a) and the *Daily Evening Echo* claims 140,000. The London *Daily News* has been steadily gaining upon its competitors for some years back, and its present circulation may be safely placed at 100,000. In Paris *Le Petit Journal* prints daily 130,000 copies, and the *Figaro*, which is generally believed to be the journal nearest it in circulation, prints 70,000 copies daily.

The largest average daily circulation claimed by any one of the New York journals is 120,000. On frequent occasions, in response to an extraordinary demand, the leading journals will print an issue whose numbers closely approximate the largest average given for the *Telegraph*, of London, or *Le Petit Journal*, of Paris. The Boston *Herald*, situated in a city not more than half the size of New York, publishes on the average 100,000 papers, and can on occasion increase this number almost as much as it is increased in New York.

Circulation of the New York daily newspapers.

It may be added that there is no other European country in which the circulation of the daily newspapers reaches figures that approximate the dimensions of those of London, Paris, and New York. The *Allgemeine Zeitung*, of Augsburg, is believed to be the only German paper which has yet reached a circulation above 50,000; and it is a suggestive fact that the German daily with the largest circulation is published in the city of New York.

Newspaper circulations in continental Europe.

The latest authentic figures I have been able to obtain relating to the circulation of the German newspapers showed in the German empire, in 1875, thirteen daily newspapers which issued between 10,000 and 20,000 copies regularly, six which issued between 20,000 and 30,000, and two only which published more than 30,000—the *Cologne Zeitung* and the *Berlin Volkszeitung*. The periodical publications of a literary character, for the entertainment of the people, have a circulation in Germany exceeding in dimensions that of the same class of publications in the United States. Thus the *Gartenlaube* in 1875 sold 328,000 per issue, the *Familienzeitung*, illustrated, 200,000, and the *Modenwelt* 156,000. These figures exceed any that can be given for this country, although the aggregate circulation of this class of periodicals is much greater in the United States, in proportion to the population, than in Germany.

In Italy and Spain 5,000 is considered a large circulation for the best journals that are published, and the most popular paper in the former country (*Opinione*) did not exceed 20,000 copies, even during the excitement of the war of 1859. The *Unita Cattolica*, for a number of years the most firmly established Italian paper, never exceeded a circulation of 10,000.

THE RELATIONS OF THE UNITED STATES POST-OFFICE DEPARTMENT TO THE NEWSPAPER PRESS.

The relations existing between the post-office department of the United States government and the newspaper and periodical press have always been peculiarly intimate, and present a most interesting theme of investigation. No attempt has ever been made to historically trace the development of these relations, and much material which would shed interesting light upon the subject is unfortunately not now available. In the pursuit of an investigation which seemed to be a natural and necessary complement of a report of this character the special agent applied to the post-office authorities and was courteously permitted the use of all the public documents and other data in the possession of the department, and was afforded every facility for making a thorough and satisfactory investigation, with such advice and assistance as it was in the power of the officers in charge of this branch of the government to render. The results are presented in chronological form.

An investigation now first made.

The post-office service and the newspaper press have developed together. At the beginning the press leaned upon the department, depending altogether upon its assistance for expediting its circulation. The government, on the other hand, assumed somewhat of the attitude of a patron of the newspaper press, and avowedly undertook to encourage its growth as the most important disseminator of intelligence among the people. When the postal system of the United States was first organized, the press of the country was insignificant in character and volume, and its issues did not promise any very great burden to the mails. The rates of newspaper postage were therefore fixed at much lower figures than those charged for the transmission of letters, as they have in fact remained from that day to this.

A simultaneous development.

By the postal act of 1793 the rates of postage charged for a single letter (*i. e.*, one composed of a single sheet of paper) were: Under 40 miles, 8 cents; under 90 miles, 10 cents; under 150 miles, 12½ cents; under 300 miles, 17 cents; under 500 miles, 20 cents; over 500 miles, 25 cents; while newspapers were sent under 100 miles, or within the state where published, for 1 cent each, over 100 miles

The first federal postal act.

^a The daily circulation of the London *Telegraph*, recently certified by public accountants, averages over 260,000. The weight of paper used each morning is 21 tons. The paper is printed on ten Hoe machines, which turn out an average of 120,000 copies per hour.—Joseph Hatton, in *Harper's Magazine*, 1881.

and out of the state where published, 1½ cents. Magazines and pamphlets, 1½ cents a sheet under 100 miles; if periodicals, over 100 miles, 2½ cents a sheet; if not periodicals, 4 and 6 cents. The provisions of the postal act of 1793, so far as they relate to the transmission of newspapers and periodicals, were as follows:

Extracts from the act
of 1793.

SEC. 21. That every printer of newspapers may send one paper to each and every other printer of newspapers in the United States free of postage, under such regulations as the Postmaster-General may provide.

SEC. 22. *And be it further enacted*, That all newspapers conveyed in the mail shall be under cover, open at one end, and carried in separate bags from the letters, and charged with the payment of one cent each for any distance not over one hundred miles, and one and a half cents for any greater distance: *Provided*, That the postage for a single newspaper from any one place to another in the same state shall not exceed one cent; and that where the size of mails and the mode of conveyance will admit of it, magazines and pamphlets may be transported in the mails at one cent per sheet if conveyed any distance not exceeding fifty miles, one and a half cents for any distance over fifty miles and not exceeding one hundred miles, and two cents per sheet for any greater distance. And it shall be the duty of the Postmaster-General and his deputies to keep a separate account of the newspapers, magazines, and pamphlets, and the deputy postmasters shall receive fifty per cent. of the postage thereon exclusive of their own allowance.

[Additional act—same year.]

SEC. 6. That no newspaper shall be received by the deputy postmasters to be conveyed by post unless they be sufficiently dry and inclosed in proper wrappers, on which, beside the direction, shall be noted the number of papers which are inclosed for subscribers and the number for printers. The deputy postmasters shall form all newspapers deposited in their offices to be conveyed by post into mails, and if any deputy postmaster shall open or permit any other to open any mail not directed to his office to be opened, he shall, on conviction thereof, forfeit for such an offense a sum not exceeding twenty dollars.

But one principle of difference in rates in the postal transmission of newspapers was recognized in the original postal act, while two distinct principles were adopted in reference to the transmission of letters. Newspapers paid one cent postage for all distances within 100 miles, and a cent and one half for all greater distances, without reference to their weight, while letters paid postage, according to their weight, upon a graduated scale of distances.

Different principle in
newspaper and letter
postage.

These rates made the burden of letter postage an onerous one from the start, while it was never claimed that the postage then charged upon newspapers was other than a reasonable one. The theory was that the cost of the mail service was to be paid out of the letter postage, and that the newspapers were to have the advantage of the revenues thus created for their contemporaneous transmission through the mails.

Nevertheless the principles adopted in the first postal law remained unchanged for half a century. The following letter of Postmaster-General Barry to Hon. Felix Grundy, chairman of the Senate committee on post-offices, written in 1833, contains a *résumé* of the postal laws and their modifications up to that date:

Postal modifications u
to 1833.

SIR: In answer to your inquiry, I beg to state that from the earliest period of our government, when the circulating medium was much more limited, and consequently its nominal value was greater than at present, there has been no essential variation in the price of letter postage, as will be seen by the following statement:

Miles.	Not exceeding—	Cents.
30	60	8
60	100	10
100	150	12½
150	200	15
200	250	17
250	350	20
350	450	22
450		25

Newspaper postage on distances not exceeding 100 miles, 1 cent; exceeding 100 miles, 1½ cents.

The law was revised by Congress in May, 1794, and the same rates of postage were again determined upon. The law of March 2, 1799, slightly reduced the rates on letter postage; newspaper postage continued as before. The law was revised in 1810, but no change was made in the rates of postage.

From February 1, 1815, to March 31, 1816, 50 per cent. was added to all postages for the purpose of raising a revenue in aid of the expenses of the war in which the country was then engaged. In April, 1816, Congress then reduced the postage on letters, but newspaper postage continued as before, except that the postage was reduced to 1 cent, though conveyed more than 100 miles for delivery in the same state in which they were printed.

In 1825 the law was revised but the rates on postage were confirmed.

Under these circumstances I am warranted in the conclusion that the rates on newspapers were so far settled that no important difference in their aggregate amount was to be contemplated, and the experience of forty years, without producing an opposite conviction in the public mind, was sufficient to justify the conclusion that the principle was settled.

On this principle all existing contracts for transporting the mails have been predicated. A reduction of the rates will require a very important reduction of the mail facilities of the country.

In relation to the postage on newspapers, the consequence of a reduction will be no less embarrassing. The expense of their transportation is very great, and their numbers are constantly multiplying. It is an occurrence of almost every day that a ton's weight of newspapers is carried in our mail hundreds of miles together, and at a rate of from 80 to upward of 100 miles a day; and if the postage

on them shall be abolished, the number will be multiplied and the cost of their transportation increased. It will probably be the means of superseding many of our village newspapers by supplying their places with papers from the cities, which will render it difficult for their rapid transportation at any expense. (a)

It is evident from the phraseology of this letter that the agitation of a reduction of letter postage began long previously included also a demand for the reduction of newspaper postage as well. Indeed, not only a reduction but the entire abolition of newspaper postage was asked. In the previous year a resolution making inquiries as to the expediency of such an abolition had passed the House of Representatives. In response to this resolution, Postmaster-General Barry wrote as follows:

Demand for a reduction of postage on letters and newspapers.

To the House Committee on Post-Offices and Post-Roads:

SIRS: I have the honor to acknowledge the receipt of your letter inclosing a resolution of the House of Representatives relative to the expediency of abolishing the postage on newspapers and periodicals, in which you inquire the amount of net revenue received from this source, and the amount of each separately; also my opinion upon the propriety of adopting this measure. Having a due regard for the prosperity of the department, and with no other intention than that which may be useful to the committee in forming a correct opinion on the subject, to the first inquiry I will observe that the amounts of postage on newspapers and pamphlets are kept together, without distinguishing one from the other. The commission of postmasters is the same on both, and no occasion has ever arisen for separating them in the books of the department. The postage on pamphlets which are not periodicals is very inconsiderable. The intention of the law appears to be to evade and discourage their transmission by mail, except in cases where it might be required as a matter of considerable interest to the object which is to be accomplished. The postage on newspapers and periodicals arises principally from the former, probably more than four-fifths of the whole. The remainder is almost entirely on periodical pamphlets.

The gross amount of postage on newspapers and pamphlets for the year ending June 30, 1830, was \$196,606 34; that for the year ending June 30, 1831, was \$223,485 01. The increase in one year was \$26,878 67. The commission allowed to postmasters on newspapers and pamphlets is 50 per cent. of the gross amount; but by reserving to the department the fractions of cents the net proceeds are a little more than one-half the gross amount.

The net proceeds of postage on newspapers and pamphlets for the first above-mentioned year amounted to \$98,513 44; for the second year, \$112,111 22. The increase in the net proceeds was \$13,597 78.

To the second inquiry I have the honor to submit the following remarks:

The increase of postage on newspapers is in a greater ratio than that on letters; and the increase of postage of every description is in a ratio considerably beyond that of the population and business of the country. This great ratio of increase has resulted from the greatly increased facilities which have been given to communications by mail.

Having perceived at an early day the propriety and necessity of making such improvements in some of the leading mail-routes as would be calculated to draw every kind of communication as much as possible into the mails, and would thus increase the revenue to a greater amount than the increased expenditure required for such improvements, my attention has been constantly directed to this object. The propriety of the course adopted has been justified by the results. The improvements have called for a considerable expense, yet they have increased the revenue beyond their cost. But if improvements should now cease to be made, the ratio of increase of the revenue will be of necessity diminished.

^a The text of the act of 1825, so far as it related to newspapers, was as follows:

"SEC. 30. That all newspapers conveyed in the mails shall be under cover and open at one end and charged with a postage of one cent each for any distance more than one hundred miles, and one and a half cents for any greater distance, provided that the postage on a single newspaper from any one place to another in the same state shall not exceed one cent; and the Postmaster-General shall require those who receive newspapers by post to pay always the amount of one quarter's postage in advance; and should the publisher of any newspaper, after being three months previously informed that his newspaper is not taken out of the office to which it is sent for delivery, continue to forward such paper in the mails, the postmaster to whose office such paper is sent may dispose of the same for the postage unless the publisher pay it.

"If any person employed in the department of the post-office shall improperly detain, delay, embezzle, or destroy any newspaper, or shall permit any other person to do the like, or shall open or permit another to open any mail, or take a newspaper not directed to the office where he is employed, said offender shall, on conviction thereof, forfeit a sum not exceeding fifty dollars for each said offense, and if any other person shall open or take a newspaper, or shall embezzle or destroy the same, not being directed to such person, or not being authorized to receive or open the same, said offender, on conviction thereof, shall pay a sum not exceeding twenty dollars for every such offense.

"If any person shall take or steal any packet, book, or mail of newspapers from or out of any post-office, or from any person having custody thereof, such person shall upon conviction be imprisoned not more than three months for every such offense and be kept at hard labor during such imprisonment.

"If any person shall inclose or conceal a letter or other thing or any memorandum or writing in any newspaper, pamphlet, or magazine, or in any packages of newspapers, pamphlets, or magazines, or make any writing or memorandum thereon which he shall have delivered into any post-office, or to any person for that purpose, in order that the same may be carried by post for letter postage, he shall, on conviction thereof, forfeit or pay the sum of five dollars for each and every offense, and the newspaper package or memoranda intended to be delivered to the person to whom it is directed shall be held till the amount of single letter postage is paid for each article of which the package is composed.

"No newspapers shall be received by the postmaster to be conveyed by post unless they are sufficiently dried and inclosed in paper wrappers on which, beside the direction, shall be noted the number of papers which are inclosed for subscribers and the number for printers, provided that the number intended be indorsed.

"The postmaster, in any contract he may enter into for the conveyance of the mail, may authorize the person with whom such contract is to be made, to carry newspapers, magazines, and pamphlets other than those conveyed in the mails; provided that no preference shall be given to the publisher of one newspaper over another in the same place. When the mode of conveyance and the size of the mail will admit of it, such magazines and pamphlets as are published periodically may be transmitted through the mails to subscribers at one and one half cents a sheet to any distance not exceeding one hundred miles, and two and one half cents for any greater distance. And such magazines and pamphlets as are not published periodically, if sent in the mails, shall be charged with a postage of four cents on each sheet for any distance not exceeding one hundred miles and six cents for any greater distance."

The gross amount of postage for the year ending June 30, 1833, may be fairly estimated at \$249,000, and the net revenue at \$125,000. If the postage shall be abolished on newspapers and pamphlets, it will materially diminish the earnings of postmasters, as their compensation generally does not now exceed a fair equivalent for their labor. They would probably solicit an increase of commissions on letter postage. Should this be granted, the diminished means for carrying on the operations of the department and for that progress of improvement which the country demands would consequently be \$249,000 for the first year, with a loss of its progressive increase from year to year; and if the postmasters should be denied an increase of commission to counterbalance the loss they will sustain in being deprived of this part of their compensation, the immediate diminution to the net revenue of the department would amount to \$125,000 a year. There must also be estimated the increased expense of transporting the mails incurred by the additional weight which would be added to it. * * * Should the measure be adopted, it would give an immediate check to all further improvement to mail facilities. In order to preserve the rapidity and certainty of the connections now secured between the large commercial towns it will probably be necessary to provide for separating newspapers from the letter mail. The newspapers and periodicals are held to be of inestimable value to the community, though it has not yet been considered to be the duty of the government to distribute them through the Union entirely at the public expense. The freedom of the press guaranteed by the Constitution, and the small share of postage with which these publications are charged, compared with the whole expense of their transportation, demonstrate the estimation in which they are held by the government. If they should be transported entirely free of postage, an equivalent amount appropriated from the treasury for their transmission would be at the expense of the government, or if the department shall depend upon its own resources alone, then their transmission will be at the expense of those who pay the revenue in postage on letters.

From the preceding view of the facts the committee will judge of the policy and justice of adopting either of the alternatives stated, and how far the energies of the department would be embarrassed by abstracting from it the revenue derived from newspapers and pamphlets, at the same time adding to its charges the increased number which it would be required to transport. (a)

A bill for the abolition of the postage on newspapers having been introduced in the Senate and referred to the committee on post-offices and post-roads, that committee, through its chairman, made the following adverse report on May 19, 1832:

Proposed abolition of newspaper postage.

The committee beg leave to report that they are aware of the importance of advancing information throughout the community through the medium of newspapers, and that it is the duty of the government to promote an object so laudable and desirable, so far as is consistent with the successful operations of the post-office department. The other great interests of the country, the safety of the department, and the beneficial effects which are everywhere felt from its operation, should not be hazarded for slight cost, nor should the principles of justice and equity be sacrificed for the attainment of fancied benefits wrought in any other but a tangible and durable form.

The object of the bill is a more extensive circulation of newspapers; and if this object be attained, it must in the same proportion increase the burdens of the mail. This will operate unjustly and press heavily upon the mail contractors who have already entered into obligations to meet their arrangements without reference to the new state of things which would be produced by the passage of this bill.

The postage on newspapers and pamphlets for the three years ending July 1, 1833, was as follows: 1829, \$180,656 48; 1830, \$205,098 55; 1831, \$228,876 56. On the same progressive ratio of increase they will for the current year amount to upward of \$250,000. Of this sum not more than one-fifth was derived from periodicals and pamphlets; and if the postage on newspapers shall be abolished, it is probable that most of the periodicals and pamphlets will assume the form and character of newspapers.

One-half of this sum is retained by the postmasters on account of compensation for their services. If this part of their compensation shall be taken from them, while their labor is increased, it would be but equitable to increase their compensation in some other way. And if no remuneration shall be made to postmasters in lieu of the compensation which would be withdrawn by the passage of this bill, yet will the law establishing new rates impose upon the department an additional burden of from \$100,000 to \$234,000 per annum. The passage of this bill will deprive it of the means of sustaining itself, by diminishing its revenue more than \$100,000.

From a careful investigation of the subject the committee are satisfied that the provisions of the bill cannot be sustained without an annual appropriation from the treasury, and that appropriation must be increased from year to year, for the increase of newspaper postage is greater than the increase of letter postage in a duplicate ratio. The increase of the weight of newspaper mails, even while subject to postage, is to the increase of letter mails as about thirty to one. It must then be obvious that, if the revenues arising on letter postage are not sufficient to defray the expense of transporting the letters and newspapers conveyed in the mails, the deficiency will continue to increase as the weight of the mail shall increase. The measure would probably in a few years become a serious burden to the treasury,

^a As an illustration of the difficulties with which publishers had to contend, as well as the post-office department, because of these dead papers, we reproduce the following circular, addressed by Thomas Ritchie, of the *Richmond Enquirer*, to the postmasters at every office to which one or more of his papers were sent in 1819:

"SIR: In these times it is a point of some importance to save as much as I can. One dead paper at one post-office may be a trifle; but one paper lying dead at 150 or 200 offices may amount in the year to a very serious loss. I have therefore determined to address a circular letter to each of the post-offices to which the *Enquirer* is forwarded, respectfully requesting the postmasters to inform me if there be any of its papers not taken up by the subscriber to whom it is addressed.

"It would be an additional obligation to me if you, sir, would add why the paper is not taken up; if the subscriber be dead, who is his representative; if removed, to what state he has emigrated; and any other information touching the matter which you may deem important for me to possess.

"You would also serve me essentially by informing me whether the *Enquirer* comes regularly to your office, and whether there be any change in its route or in the run of the mails which might make it arrive sooner at its place of destination.

"I have nothing else to offer you, sir, for any attention you may pay me in this way than the sincere thanks of one who works hard for the bread which he eats, and who is therefore unwilling to throw away any of his work. I am encouraged to hope for success in this application by the recollection that three years ago I made a similar experiment, whose results were as pleasing to me at the time as they have since been profitable. I have now on file more than one hundred very obliging letters in reply to mine; and the information thus kindly communicated saved me from fifty to one hundred papers annually, which had otherwise been wasted 'upon the desert air'.

"Any information you can furnish now or hereafter about the transmission of my papers will be gratefully acknowledged by, sir, your obedient servant,

"THOMAS RITCHIE."

and might prove the foundation for a pretext at no distant day for imposing a tax on newspapers as an equivalent for the expense of their transportation—a measure which at this time would meet the disapprobation of the whole community.

The inevitable consequence of passing this bill would be to resort to the treasury for the transportation of newspapers. To such a resort there are many and, in the opinion of the committee, very weighty objections.

Newspapers cannot be transported without expense, and they are generally distributed by the mail at a much lower rate than in any other way that can be devised. The price fixed is much lower than the actual cost to the department. If they were excluded from the mails, the weight would be so diminished as greatly to diminish the expense of transportation. It is the weight of the mail that subjects it to heavy charges for transportation; and from the best estimate that can be made the weight of the letters transported in all the mails of the United States does not amount to more than one-fifteenth part of the whole weight, yet the postage on letters for the year ending the 1st of October last amounted to \$1,823,563 08, and the postage on newspapers and pamphlets for the same period amounted to \$228,876 56, about one-eighth part of the same for fifteen times the weight.

The postage on newspapers is not a tax. It is no more in the nature of a tax than is the freight paid on merchandise. It is money paid for a fair and full equivalent in service rendered, and paid by the person for whose benefit and by whose venture the service is performed. The law does not require newspapers to be distributed by the mails. It only extends to their proprietors that privilege when it becomes their interest to avail themselves of it in preference to other and more uncertain and expensive modes of conveyance. There does not appear any sufficient reason why the public should pay for transporting printers' articles or merchandise to a distant market any more than the productions of other kinds of industry. In all cases the expense must be defrayed either by a tax or by the person for whom the service is performed; and the committee cannot perceive a more equitable way than for each one to pay for the services actually rendered to himself for his own benefit and by his own order.

From whatever source the revenue to be applied to that object shall be derived, yet it is drawn from the public, and if the bill shall pass it will in fact impose a tax upon the people for the transportation of newspapers. The greatest benefit from this tax will accrue to him who receives the greatest number of distant newspapers. The operation then will not be in favor of the laboring class of the community. The industrious and useful farmer or mechanic generally contents himself with one or two weekly newspapers, while his more wealthy neighbor is able to indulge himself with as many every day. The measure will therefore operate as a tax for the benefit of the wealthy at the expense of his more industrious and useful neighbor. The committee do not perceive the justice of taxing that portion of the community who read the fewest papers for the benefit of those who read the most.

The effect this bill would have upon the newspaper establishments of the country, and indeed upon the political character of the nation, is a subject worthy of deep consideration. There is a prevailing curiosity in the interior to see and read the papers which are published in the large cities, and to learn the news and rumors which are circulated there. If these papers shall be transported without expense, it is apparent that they will be generally preferred, although all the useful intelligence that they contain is now circulated, with but a few hours delay, through the medium of the local press.

The city editors, by fixing agents in the different towns and villages to receive and circulate their papers, will depress and finally supplant the smaller establishments and monopolize the news of the large cities, whose political atmosphere is not always the most congenial to the spirit of independence or calculated to promote that manliness of spirit which has always characterized the great body of the common people of our country; and that spirit which constitutes the safeguard of our liberties will gradually decline, and the loss consequent upon such a state of things cannot be compensated by any saving of postage on newspapers. A concentration of political power in the hands of a few individuals is of all things the most to be dreaded in a republic. It is of itself an aristocracy more dangerous and potent than any other, and nothing will tend more to prevent it than the sustaining of the newspaper establishments in the towns and villages throughout the country.

The committee, upon a full view of the subject, are of the opinion that it would be entirely inexpedient to pass the bill, and therefore recommend its indefinite postponement.

The soundness of the argument advanced by this committee against the free carriage of newspapers in the post has been demonstrated by the experience of more recent years. At the particular period of the preceding report there was a great deal of complaint on the part of the publishers of interior newspapers that the postal laws already discriminated most unjustly in favor of the metropolitan newspapers. These mammoth papers—for this was the golden era of the New York "blanket sheet"—were carried long distances at the same rates of postage charged to the smaller local press, and they conveyed the latest news to the people of the interior towns earlier than the publishers in the latter, obliged to wait for their news for the arrival of the same papers, could republish and circulate it. Thus the mail service was the real cause of that concentration of political influence about a few centrally-located newspapers, which has been spoken of elsewhere in this report as one of the marked journalistic characteristics of the second era. It was the mail facilities they enjoyed which gave to newspapers like the *National Intelligencer*, of Washington, a reputation and a circulation all over the Union such as no paper, however superior, can command in these days of telegraphic communication. Everywhere the people were obliged to await the arrival of the *Intelligencer* before they could learn what had transpired in Washington on the day previous to its publication, and the gentlemen of this committee were naturally affrighted by the vision of the concentration of political power about a few establishments, which this state of things, if left to the development then in progress, would eventually work. But the invention of the telegraph put all the journals of the Union on a par with respect to priority in the publication of the news, and thus restored journalistic development in the United States to healthy and natural conditions.

Inequalities of newspaper postage rates.

Consolidation of newspaper power the consequence.

In the meanwhile the department continued to devote its energies to facilitating the rapid transmission of newspapers in the mails. The following extract from the annual report of Postmaster-General Amos Kendall for 1835 shows the early recognition of the steamboat and railroad as a revolutionizing element in postal history:

Railroads and steamboats as mail carriers.

Sufficient attention has been given by the undersigned to the manner in which newspapers and other printed matter are conveyed through the mails to satisfy him that it is radically defective. No supervision or power to punish exercised or bestowed by the Postmaster-General is able to prevent on some occasions the canvas bags in which printed matter is stowed from being left behind, so long

as they are being carried separately from the letter mails or on the outside of coaches and stages. To prevent the evil in some degree, it has been provided in the contracts lately awarded on the mail routes to the West that on the outward trips no passengers shall be carried in the mail-coach, and that it shall be devoted exclusively to the mails, and on similar routes along the seaboard the same restriction will be applied in that direction. It is believed that the enforcement of the contracts in this respect will insure the safe conveyance of the newspapers so far as they travel on these routes.

A very great improvement in this respect is anticipated by the arrangements now in progress to run steamboat mails on the rivers during steamboat navigation and on a portion of the Mississippi during the whole year. The multiplication of railroads will form a new era in the mail establishment; they must soon become the means by which the mails will be transported on most of the great lines of intercommunication; and the undersigned has devoted some attention to the devising of a system which shall render the change most useful to the country.

The same report of Mr. Kendall broached a subject in connection with the mail transmission of newspapers which had already made much excitement in the southern states, and constitutes one of the most interesting chapters in the history of the relation of the United States mail to the newspaper and periodical press. Mr. Kendall's report continues:

Federal supervision over the contents of newspapers carried in the mails.

A new question has arisen in this department. A number of individuals have established an association in the northern and eastern states, and have raised a large sum of money, for the purpose of effecting an immediate abolition of slavery in the southern states. One of the means resorted to has been the printing of a large mass of newspapers, pamphlets, tracts, and almanacs containing exaggerated and, in many instances, false accounts of the treatment of slaves, illustrated with cuts calculated to operate on the passions of the colored men and produce discontent, assassination, and civil war. These they attempt to disseminate through the slaveholding states by the agency of the public mails.

As soon as it was ascertained that the mails contained these productions great excitement arose, particularly in Charleston, South Carolina, and to insure the safety of the mail in its course southward the postmaster agreed to retain them in his office till he could obtain instructions from the Postmaster-General. In reply to his appeal he was informed that it was a subject upon which the Postmaster-General had no legal authority to instruct him. (a) The question again came up from the postmaster at New York, who had refused to send the papers by the steamboat mail to Charleston, South Carolina, to whom I also answered that the Postmaster-General possessed no legal authority to give instructions on the subject. But as the undersigned had no doubt that the circumstances of the case justified the detention of the papers, he did not hesitate to say so. Important principles are involved in this question, and it merits the grave consideration of all the departments of the government.

There is no quarter whence domestic violence is so much to be apprehended in some of the states as from some of the servile population preyed upon by mistaken or designing men. It is to obviate danger from this quarter that so many of the state laws in relation to the circulation of incendiary papers have been enacted.

Without claiming for the general government the power to pass laws forbidding discussions of any sort as to the means of protecting states from domestic violence, it may safely be assumed that the United States have no right, through their officers or departments, knowingly to be instrumental in producing within the several states the very mischief which the Constitution commands them to repress. It would be an extraordinary construction of the powers of the general government to maintain that they are bound to afford the agency of their mails and post-offices to counteract the views of their citizens in the circulation of papers calculated to produce domestic violence, when it would be at the same time one of their most important constitutional duties to protect the states against the natural, if not necessary, consequences produced by that very agency. The position assumed by this department is believed to have produced the effect of withholding its agency generally in giving circulation to the obnoxious papers in the southern states. Whether it be necessary more effectually to prevent by legislative enactments the use of the mails as a means of avoiding the violation of constitutional laws of the states in reference to this portion of their respective rights is a question which, it appears to the undersigned, may be submitted to Congress upon the statement of the facts and their own knowledge of the public interest.

In the extreme view here advocated, of the right of the general government to exercise a discretionary supervision over the character of the contents of newspapers conveyed in the mails, Mr. Kendall reflected the sentiment of the administration and of a large element in the democratic party. The annual message of President Jackson for the same year contained the following passage on this subject:

President Jackson advocates the right of federal supervision.

I must also invite your attention to the painful excitement produced in the South by attempts to circulate through the mails inflammatory appeals addressed to the passions of the slaves, in prints and in various sorts of publications calculated to stimulate them to insurrection and to produce all the horrors of a servile war.

There is doubtless no respectable portion of our fellow-countrymen who can be so far misled as to feel any other sentiment than that of indignant regret at conduct so repugnant to the principles of our national compact and to the dictates of humanity and religion. Our happiness and prosperity essentially depend upon peace within our borders, and peace depends upon the maintenance, in good faith, of those compromises of the Constitution upon which the Union is founded. It is fortunate for the country that the good sense, the generous feeling, and the deep-rooted attachment of the people of the non-slaveholding states of the Union, and their fellow-citizens of the same blood in the South, have given so strong and impressive a tone to the sentiments entertained against the proceedings of the misguided

a Postmaster-General Kendall wrote as follows to the postmaster of Charleston, South Carolina, in response to a request for instructions as to how he should dispose of "incendiary documents" received at that office. It should be added that before the answer to the request came a public meeting was held in Charleston, which unanimously resolved that the matter in question should be burned, and this resolution was carried out, the mails being searched and rifled for that purpose:

"I am satisfied that the Postmaster-General has no legal authority to exclude newspapers from the mails, or to prohibit their carriage or delivery on account of their character or tendency, real or supposed. * * * But I am not prepared to direct you to forward or deliver the papers of which you speak. * * * By no act of mine, official or private, could I be induced to aid, knowingly, in giving circulation to newspapers of this description, directly or indirectly. We owe an obligation to the laws, but a higher one to the communities in which we live; and if the former be permitted to destroy the latter, it is patriotism to disregard them. Entertaining these views, I cannot sanction, and will not condemn, the step you have taken. Your justification must be looked for in the character of the papers detained and the circumstances by which you are surrounded."

persons who have engaged in these unconstitutional and wicked attempts, and especially against the emissaries from foreign parts who have dared to interfere in this matter, as to authorize the hope that those attempts will be no longer persisted in; but if these expressions of the public will shall not be sufficient to effect so desirable a result, not a doubt can be entertained that the non-slaveholding states, so far from countenancing the slightest interference with the constitutional rights of the South, will be prompt to exercise their authority in suppressing, so far as in them lies, whatever is calculated to produce the evil.

In leaving the care of the other branches of this interesting subject to the state authorities to whom they properly belong, it is nevertheless proper for Congress to take such measures as will prevent the post-office department, which was designed to foster an amiable intercourse and correspondence between all the members of the confederacy, from being used as an instrument of an opposite character. The general government, to which the great trust is confided of preserving inviolate the relations created among the states by the Constitution, is especially bound to avoid, in its own action, anything which may disturb them. I would therefore call the especial attention of Congress to the subject, and respectfully suggest the propriety of passing such a law as will prohibit, under severe penalties, the circulation in the southern states, through the mail, of incendiary publications intended to instigate the slaves to insurrection.

President Jackson's recommendation for the prohibition by law of the circulation of incendiary matter through the mails was referred by the Senate to a select committee, of which John C. Calhoun, of South Carolina, was chairman. Mr. Calhoun reported, February 4, 1836, that the measure proposed by the executive would violate the Constitution and imperil public liberty. The report says:

A Senate committee denies the right.

Nothing is more clear than that the admission of the right of Congress to determine what papers are incendiary, and as such to prohibit their circulation through the mails, necessarily involves the right to determine what are not incendiary and enforce their circulation. * * * If Congress may this year decide what incendiary publications are, they may next year decide what they are not, and thus laden their mails with real or covert abolitionism. * * * It belongs to the states, and not to Congress, to determine what is and what is not calculated to disturb their security.

Mr. Calhoun proposed that each state should determine for itself what kind of reading it would deem "incendiary", and that Congress should thereupon prohibit the transmission by mail of such matter to that state. His report concluded with a bill, which contained this provision:

State supervision proposed.

Be it enacted, &c., That it shall not be lawful for any deputy postmaster in any state, territory, or district of the United States knowingly to deliver to any person whatsoever any pamphlet, newspaper, handbill, or other printed matter or pictorial representation, touching the subject of slavery, where by the laws of said state, territory, or district their circulation is prohibited; and any deputy postmaster who shall be guilty thereof shall be forthwith removed from office.

This bill was ordered to a third reading in the Senate by ayes 18, nays 17—Mr. Van Buren, the vice-president, giving the casting vote in the affirmative. It failed, however, to pass, and that ended the matter.

The following year Postmaster-General Kendall returned to the subject of the inequalities of newspaper postage, especially complaining of the constantly increasing cost and trouble to which their transmission subjected the department and of the great injustice done the local press for the benefit of the metropolitan journals. He said (December 5, 1836):

Injustice to local press due to unequal postal rates.

Great changes have taken place in the newspaper business of the country since the present rates of postage were established. Newspapers have not only increased in number, but many of them have grown to an inordinate size. Postage, however, is the same, whether the newspaper be great or small. If not carried over one hundred miles out of the state where printed it is one cent; if out of the state, and over one hundred miles, one and one-half cents. The policy of reducing the rate of postage on newspapers generally is doubted. They constitute in weight over two-thirds of the mails, are in many parts of the country difficult of transportation, and produce numerous failures. These considerations would be of no moment if it were really necessary that large quantities of newspapers should be transported from one end of the Union to the other as a means of instructing and enlightening the public mind, but that phase can be as well provided for by the local press as by the newspapers from a distance. To reduce the rates of postage on newspapers below the actual cost of carrying them would be to tax the correspondence of the country generally for the benefit of the large newspaper establishments in the principal cities, to the injury of the distant and country press. Such a measure is not believed to be consistent with sound principle or good policy. It is not sound principle to tax the business of one portion of the people for the benefit of another portion. It is not good policy to aid the large city establishments in monopolizing the newspaper circulation to the exclusion of the local and country press. But there is just and good policy in graduating the postage on newspapers according to the size and weight of the matter to be conveyed.

The following scale of newspaper postage is therefore suggested in lieu of the present, namely:

Size of paper.	RATES OF POSTAGE.	
	Carried not over 200 miles nor out of the state.	Carried over 200 miles and out of the state.
	<i>Cents.</i>	<i>Cents.</i>
Between 550 square inches or under	$\frac{1}{2}$	1
Between 550 square inches and under 920..	1	$1\frac{1}{2}$
Over 920 square inches.....	$1\frac{1}{2}$	2

If these rates were reduced one-half, it would not materially diminish the means of the department, provided the entire newspaper postage were paid in advance. So great an innovation would probably be inexpedient. But where editors will pay in advance the postage on their whole impression sent by mail the Postmaster-General might be safely authorized to accept one-half of the foregoing rates. Circular newspapers are now extensively used, of every device and conventional size, all answering the purposes of letters, to evade the payment of postage. It would check this abuse if they were in all cases subject to double postage, to be paid in advance.

The rates of postage on periodicals and pamphlets may be as judiciously regulated upon the same principle as that suggested for the newspapers, and reduced to the least rate which will pay for their transportation.

If a preference be given to anything, it should be to works of agriculture, science, and mechanical arts; but the principle I believe to be a good one in relation to mails that everything ought to pay its own way.

To render the department measurably independent of the railroads and accomplish other important results an express mail has been started on the great mail line between New York and New Orleans. The great express mail is five days and seventeen hours going from New York to Mobile, and one day is occupied in transporting the mails between Mobile and New Orleans. This mail leaves far behind the news conveyed by railroad or any other means. The editors and the people of New Orleans will receive the news from New York in less than half the time it has heretofore occupied in its transmission. The editors will have the advantage of being the original dispensers of the news to their subscribers, and the people will obtain it from their own papers without postage five or six days sooner than it can reach them by the New York papers with postage. The editors and people along the whole road and to the right and left will participate in the same advantages to a greater or less degree.

On the other hand, the circulation in the South of newspapers from the principal cities in the North will undoubtedly be diminished. This injury is more than counterbalanced by the benefit secured to the local establishments; and if it were not, it is not to be brought into competition with the advantages of an earlier transmission and dissemination of commercial and other intelligence. No measure should be taken to injure the great city establishments, but it would be unreasonable and unjust to withhold information from the people of the South because the mail cannot carry with equal expedition the cumbrous sheets from the northern newspaper presses.

The above extract contains the first suggestion, officially made, of the advantage to the postal service that would result from the establishment of the principle of prepayment of all newspaper postage as the condition-precendent to a reduction of the existing rates. Meanwhile the agitation for a reduction both of letter and newspaper postage continued to increase, and Congress was flooded with petitions and memorials on the subject. In May, 1838, Mr. Montgomery, from the House committee on post-offices and post-roads, submitted a report on sundry petitions and memorials relating to the reduction of postage on letters and newspapers, in the course of which it was said that—

Prepayment of all newspaper postage first suggested.

The committee have not yet been able to agree on any change in the postage of newspapers, pamphlets, and other printed matter sent by mail; but all agree that some change is desirable and necessary, in order to make the postage more equitable. The committee still have the subject under consideration, and should they be able to agree upon a change they will report the subject to the House. From the facts contained in the annexed letter of the Postmaster-General, it is obvious that there is a great disparity in the postage on newspapers, pamphlets, periodicals, etc., and great disparity between the postage on newspapers, pamphlets, etc., sent by mail and the postage on letters.

The letter of Postmaster-General Kendall, replying to a request from the committee for the size in square inches and the weight and number of newspapers, with a statement of their comparative postage when sent by mail, and any other information relative to newspapers and pamphlets that he might deem necessary to supply, contained the following:

The lowest rate of newspaper postage is now one cent, half of which goes to the postmasters, leaving only half a cent to pay for transportation and other incidental expenses. This undoubtedly falls short of the actual cost for this service to the department, and there are many considerations dissuading from an increase of this rate on newspapers of a reasonable size. The distance upon which this rate is chargeable is within the limits of each state, and 100 miles if carried out of the state where mailed. It seems to me inexpedient to disturb or compromise the principle upon which this provision is founded, or alter the lowest rate on newspapers or papers of a moderate size. The same objection does not extend to an adjustment of postage on newspapers carried out of the state where printed and over 100 miles. On the contrary, the public interests of the several states as well as of the local press throughout the Union require that newspapers conveyed great distances shall be subject to a rate of postage which will approximate the cost of transportation and delivery. More especially is it desirable that the expense of transportation and delivery should be levied upon these large sheets, three-fourths of which are filled with matter of no utility to the distant reader. If the department be required to transport useless matter of this sort, those who send or receive it should pay the cost, instead of throwing it upon the letter correspondents; and it is believed to be good policy in reference to the public interests and the interests of the press generally, as well as to the convenience of the mail service, to discourage, so far as can be done, the inordinate size of newspapers which is now so much in fashion, especially when they are to be conveyed by mail.

By the existing law every publisher of a newspaper is allowed to receive free of charge one copy of every other newspaper published in the United States. When this provision was adopted the number of newspapers printed in the whole Union was not probably one hundred and fifty, and no inconvenience was likely to arise from the privilege granted. Now the number of newspapers published in the Union is believed to be from thirteen to fifteen hundred, and some publishers exchange with five or six hundred. Of these, not one hundred are of any practical use to them. They serve merely to overload and delay the mails, and are generally thrown away without being opened. It is found that on the express lines all news of importance is now sent in slips, not exceeding two columns in size, cut out of papers of from ten to eighteen columns upon a side, or printed for this special purpose, containing only one-fifth or one-ninth of the newspaper. Publishers now obtain the important news before receiving the newspaper with which they exchange. A shorter way of exchange would be accomplished by confining it to an interchange of slips, somewhat smaller in their dimensions, by the ordinary mail. It would probably be more acceptable to the printers if the permission to receive newspapers free were restricted to a certain number of papers. In relation to periodicals, pamphlets, and magazines, it is now optional with the Postmaster-General to permit them to be carried by mail or not. This discretionary power has not, however, been exercised to exclude them. On the contrary, great latitude of construction has been indulged in, which has opened the mails to a quantity of printed matter, under the name of periodicals, which is of an experiment to regulate than to abolish it. It has every year very greatly increased, and already presents a serious obstacle to the speed of the mails; and as the Postmaster-General has power to send it in separate mails, if necessary, it need not impair the efficiency of the service, provided it be made to pay the full cost of its transportation and delivery.

So many changes have taken place within a few years in the manufacture of paper, that the names used in law to designate paper for use and indicate the sizes originally intended by them render the execution of the law in reference to the class of mail matter under consideration extremely difficult and perplexing. The weight of the pamphlet, or the size of the page in square inches, without reference to the name of the paper—whether medium-roll or superior-roll—affords a certain and unchangeable criterion by which the postage may be adjusted.

In compliance with your request, I have caused a number of newspapers to be bought and weighed, and herewith send you a statement of the result. The weight of an ordinary letter is about one-fourth of an ounce. The ruling operation of existing laws upon the postage of newspapers for long distances, compared with each other and with letters, so far as weight is concerned, is illustrated by the following table:

Name of paper.	Weight.	Present postage.	Letter postage on same weight.
Eastern Argus.....	0.666	\$0 01½	\$0 50
Ohio Statesman	0.812	01½	75
Delaware Gazette	0.958	01½	75
Boston Morning Post.....	0.779	01½	75
Richmond Enquirer	1.229	01½	1 00
Pennsylvanian	1.354	01½	1 25
Pennsylvania Inquirer	1.562	01½	1 50
New York Courier and Enquirer.....	1.750	01½	1 75

It hence appears that letter postage is one hundred and sixteen times as high as newspaper postage; on the largest paper about thirty-three times as high as on the smallest, and sixty-eight times higher than the general average; so that the postage on the smallest newspaper is two and two-thirds times as high as that on the largest. From the same data, in connection with the supposed number of newspapers conveyed by mail, it is estimated that if newspapers and other printed matter paid as high postage as letters the revenues of the department would now be about \$25,000,000, instead of \$4,000,000. On the other hand, if letters paid no more by weight than newspapers, the revenues would not be \$1,000,000, and the operations of the department would be brought to a standstill.

From these facts and considerations it is abundantly evident that, if the letter correspondence were not taxed to pay for the transportation of newspapers, it would not be necessary to impose upon letters a postage exceeding 10 cents for any distance. The revenue which would accrue from two rates—one of 5 cents for short distances and 10 cents for long—would, it is not doubted, pay for the transportation of the letter mails with greater certainty and expedition than they travel now. But so radical a change in the policy of the government in connection with the mail service is not to be expected, if it is even to be desired. All that can be hoped for is that the postage on large newspapers and on those carried great distances shall be increased, to the end that their bulk and weight may be diminished, and that they may afford to the department and the community a greater proportion of the means necessary to effect their transportation.

It is not easy to determine what should be the maximum size of newspapers which shall be conveyed at the lowest rate of postage. If the question were not incumbered by the existing practice of printers, I should say it should be smaller than the daily papers in this city, so small as to give a reasonable assurance that their contents consisted chiefly of useful and interesting matter. To enable the committee to judge for themselves on this point, I send herewith the papers alluded to in the statement above. I also transmit to you a statement showing the size of the pages and the weight of sundry periodicals. The following is an exhibit of the weight, size of sheet, and rate of postage of several of these periodicals, as also the postage to which they would be subject if charged at letter rates:

Name.	Weight in ounces.	Present postage.	Letter postage on same weight.
Missionary Advocate	0.875	\$0 05	\$0 75
Thompsonian Manual.....	1.75	05	1 75
Turf Register.....	2.25	04½	2 25
Western Messenger.....	2.75	07½	2 75
So. Int. Messenger.....	4.25	10	4 25
Foster's Reprint of Blackwood.....	6.00	15	6 00
Littell's Magazine.....	6.25	10	6 25
Journal of Medicine.....	8.25	17½	8 25
Law Library	9.25	17½	9 25
North American Review	16.00	25	16 00

It will be observed that the highest weight and postage on letters, newspapers, and periodicals has been taken as the basis of this calculation.

It is proper to remark that the burden of conveying newspapers and other printed matter short distances is scarcely felt by the department. It is the masses which pass along its great connecting lines between cities and sections of the Union which are found so expensive and so difficult to convey. The weight of such matter delivered within 100 miles of the starting point would not be perceived, although it would not at present rates pay the expense of transportation. So far as that consideration is involved in the question, there is no pressing call for a change in the present policy. On the whole, I am clearly convinced that the size of the sheet and page being a tolerably correct indication of the weight, is the best basis for newspaper and pamphlet postage, and that the postage should be greatly increased on the larger size and on all of the sizes conveyed great distances, and ought to be reduced on letters in an equal ratio. But if there is to be no increase of postage on printed matter, then there should not be, at present, any reduction of postage on letters, because it would make absolutely necessary a ruinous curtailment of mail facilities.

Again, on February 24, 1838, Postmaster-General Kendall wrote to the House committee on post-offices and post-roads, in response to its request for his opinion as to the expediency of abolishing the postage on newspapers altogether. The letter was written in reply to the following resolution, passed by the House and submitted by the committee for his consideration:

Resolved, That the committee on post-offices and post-roads be instructed to inquire into the expediency of abolishing by law the postage upon newspapers; and that the said committee report to this House, first, as to the policy of abolishing postage on newspapers distributed by mails in the respective counties where the respective papers may be published; and secondly, as to all newspapers sent by mail into any part of the United States.

Postmaster-General
Kendall opposes the abolition of postage on newspapers.

The letter is as follows :

I propose to consider the latter portion of this resolution first: the expediency of abolishing postage on all newspapers conveyed by mail.

1. Newspapers and other printed matter yield the department the net revenue of half a million dollars annually. If the department was to lose this revenue, it must be followed by a ruinous retrenchment of the mail service.

2. It would operate unjustly, by taxing other interests to pay for the transportation and delivery of newspapers. Already injustice is done to letter writers and receivers by throwing upon them almost the entire expense of transporting newspapers and other printed matter. More than two-thirds and probably five-sixths of the weight transported by mail is composed of printed matter, and it pays but about one-sixth of the net revenue. To make the newspapers free, without other provision to pay for their transportation, would aggravate this injustice, and instead of affording any equivalent would act injuriously. The effect would be an additional weight of matter thrown in the mail to impede and often delay the transportation of letters. Thus the letter writers and receivers would be taxed more heavily for a worse service. And if the tax to pay for the transportation of newspapers be laid upon something else, or the expense be taken out of the general revenues of the country, the injustice will be the same.

3. It would destroy or cripple all the newspaper establishments in the interior towns and villages, and in a great measure concentrate the newspaper business in the great cities, and principally New York city. Settle the principle that the news generally be permitted to travel faster than the newspapers, and that all newspapers shall be conveyed free of charge, and the newspaper establishments in the city of New York will be almost the only ones in the Union worth possessing. Our people are eager for news, and will resort to the readiest expediency to obtain it early. If in New Orleans or Saint Louis or the Red river or the Upper Missouri, they can get it quicker in a New York paper than in those published in their own towns and villages, and as cheap too, they will take the New York papers and drop their own.

The New York press is justly entitled to the advantages of its position, but the correspondence of the whole nation ought not to be taxed to add artificial ones. Letter writers and correspondents should not be called upon to pay their money, not only to no direct benefit to themselves, nor yet for the benefit of the newspaper press generally, but to enable the New York publisher to come into competition with other publications throughout the Union and at their own doors. A tariff to produce competition is as unjust as a tariff to prevent it; the only difference is that the injury falls upon the other party. The newspapers sent by mail should pay for their own transportation and delivery, but nothing more. To relieve them from this tax is to give their proprietors a bounty to enable them to come into competition with others of their own trade throughout the Union, the advantages of which will be enjoyed by the great city press with an equivalent injury to all others.

The injury to proprietors of newspapers generally would find no equivalent in any benefit to the people; it is the news they want, and not particular newspapers. The news is just as valuable read in papers printed at their own doors as in papers printed thousands of miles off, if there be no advantage in having it quicker from the distant paper than that which they may enjoy by their own. On the other hand, a great deal may be sent by slips in closed mails or in signs or by telegraph. It is for the true interests of the country to spread intelligence with the greatest possible rapidity. Newspapers are favored in the mails because they are the means of disseminating intelligence. To withhold intelligence because newspapers cannot be carried so rapidly as intelligence may be otherwise conveyed is sacrificing the end to the means; it is sacrificing the interests of the people and the press generally to the interests of a few newspaper proprietors in the great cities or any one city; and if the people are to be taxed in order that masses of newspapers may be carried free, when the news might fly to them on horseback or through the air or instantaneously along the electric wire, they will be taxed not only without an equivalent benefit, but even to bring upon themselves a serious injury. The public wrong is aggravated by the consideration that at least three-fourths of the contents of many newspapers are totally useless to the readers when received. Look at the large daily papers of the commercial cities; they seldom contain a page of matter which is of interest to any reader outside the city where printed or in its immediate vicinity. If it were deemed to be right to tax correspondents for the purpose of sending the news free, would there be any excuse for taxes to give free transportation for mere waste paper?

There are no moral considerations which should induce Congress to give especial advantage to the city over the country press. It is not likely to be in purer hands or subject to better influences. If it be true that cities are the sores of the body-politic, the reverse is very likely to be the case.

Nor are there any practical considerations which encourage this preference. If the newspaper business be monopolized at one or a few points, there is danger that the newspapers will fall under the control of a few men of wealth and power, who will thus extend an undue influence throughout the nation. One man or a few, or one corporation or a few, may buy up the true press, and with their hired writers fail not only to advance the rights of man and the cause of liberty, but carry some great point of ambition or speculation in derogation of the rights of the people and the general interests of society. Even if corruption does not taint the purity of the press, the proposed policy will give to favored points an undue and even an injurious influence over the other portions of the Union. There may be subjects in relation to which the different sections of our country have different interests and feelings which can only be made known with due weight by a well-sustained local press. Our nation is not one in relation to the several subjects discussed in the newspapers; and in many respects we are twenty-six independent nations. Each of these has its separate interests, systems of legislation, jurisprudence, and police which require a well-sustained local press to discuss local differences, right its separate wrongs, and maintain its rank and importance among its confederates. Legislation by Congress to give advantage within its borders to the press of other cities would be of the great commercial emporiums of the nation, enabling it to disseminate, free of postage, the earliest foreign and most important domestic news in all the cities and villages of all the states, would be to destroy a great portion of the local press and extend through the states a control and consolidation both in politics and business incompatible with the true interests and even with the continuance of our federal system.

The other branch of this inquiry is as to the expediency of abolishing postage on newspapers conveyed by mail within the respective counties where they are printed. This proposition is in some respects in the opposite extreme; it would operate to the benefit of the local and country press, and in some degree to the injury of the city and other distant journals. It would therefore in particular be unjust to on newspapers sent by mail great distances is not adequate to pay the cost of transportation and delivery. Most of this cost is now paid out of the letter postage. Yet to make the local press free is deemed unjust and impolitic because it would increase the tax on letters for the benefit of newspapers, and violate the great principle that the persons whose interests are served by the government shall pay for the cost of the service.

In another respect such a measure is objectionable. It would reduce the revenues of the department, and would operate unequally. In a portion of the Union the counties are very large, being subdivided into townships for local purposes. In other portions they are small, having no subdivisions of that sort. Many of the counties in the South and West are unequal in size and population, while it is not

so in many counties of the North. Hence to make newspapers free in the counties where printed would operate much more advantageously to the latter section of the nation than to the former. The difference would be so great as to constitute of itself the fatal objection to the proposed measure.

On the whole, my opinion is that the postage on newspapers carried short distances should not be taken off, but that on newspapers carried great distances it should be increased. In short, the newspaper postage should be so regulated as to pay for the transportation and delivery of newspapers, including those sent free, and the postage on periodicals, magazines, and pamphlets should be regulated upon the same principle. Since the origin of the prevailing practice a great change has been wrought in the printing business of the country. Then there were but few newspapers and no periodicals, and indeed newspapers were published almost exclusively in the large cities. Their cheap transportation, therefore, was to establish means of disseminating their intelligence among the people. Now we find newspapers in almost every neighborhood, and periodical works have sprung up in nearly every section of the Union. The means of acquiring intelligence are therefore at the doors of the people, and it is no longer necessary to raise a tax in their interest to give transportation to newspapers with a view to their enlightenment. By disseminating intelligence to editors free the government accomplishes the great object of disseminating it freely among the people.

The size of newspapers has been greatly enlarged. It is not many years since newspapers as large as the *Globe* and the *National Intelligencer* first made their appearance. Now some of the weekly papers have swollen to great dimensions. Yet no one of these huge sheets pays more postage than the smallest penny paper of the Union. That such a graduation of postage is unequal and unjust it requires no argument to illustrate.

A new element should be made to enter into the rate of newspaper postage, and that is the size of the paper. If papers of a moderate size were fixed at one rate, and to all over that size a higher rate was charged, the effect would probably be to reduce them all to a smaller size, containing all the useful matter, and thus ridding the mails of a mass of waste paper now transported without any purpose but to the delay of the mails and the injury of the revenue.

By the present law the newspapers transported not over one hundred miles when out of the state where printed pay one cent postage, half of which goes to the postmaster who delivers them. This puts all newspapers carried not over one hundred miles when out of the state where printed at a less rate of postage, and gives advantage to the papers printed within the state over those printed out of it. Though this would be objectionable if our Union was of one opinion, yet, considering that the states are in many particulars separate and independent, it does not appear inappropriate.

Probably no better basis can be found on which to rest the lowest rates of newspaper postage than to have within these limits everywhere one rate for small papers and another higher rate for larger ones. The system would in these particulars be as perfect as it can well be made.

I would respectfully suggest a remodeling of the whole system of newspaper postage, as demanded by justice to the public interests, on a basis established upon the following proposition, viz:

On newspapers not exceeding — square inches in size and not carried over 100 miles and out of the state where printed, *one cent*.
On newspapers exceeding — square inches in size and carried as above named, — postage.

On newspapers not exceeding — square inches in size and carried over 100 miles and out of the state where printed, —. On newspapers exceeding — square inches in size and carried as above, —.

The right of printers to receive papers free should be limited to a reasonable number. The postage on periodicals, magazines, and pamphlets should be regulated on similar principles; the rates should be sufficient to cover the charge of transportation and delivery and nothing more.

Another reform in this respect is much needed, and has every day become more urgent. The mail which leaves New York city daily for the South is believed to average two tons in weight, more than a ton and a half of which is printed matter. At Baltimore it separates, and about one-half goes west and the other half south. It is now difficult to carry other than by steam-power on the sea or railroads. The stage lines, where the roads are not highly improved, are impeded daily and often broken down with this increased weight of the mails, delaying and sometimes losing the letter mails, and always injuring their valuable contents. Indeed, when one travels upon these lines and sees how the mails are piled on and in the stages, and sees how they are unloaded and exposed, he cannot but marvel that such vast sums of money and so many valuable papers are hazarded in them at all. I cannot but be impressed with the folly of attempting to convey this heavy mass with the speed required at this age for business correspondence, and with the bad policy of so legislating as to increase it, especially when no general interest is to be promoted thereby. Indeed, without the redeeming power of railroads it would be necessary under the present tendencies of things to give up the hope of transmitting letters and newspapers with the same speed and cause them to be conveyed on separate lines. But if the railroads relieve the department on some lines, they leave it to all of its embarrassments on others, and the relief which they give is at an increase of expense which the accumulating matter they convey will go but a short way to remunerate.

If the committee were disposed to adjust the newspaper postage upon the principle hereinbefore suggested, the letter postage might be greatly reduced.

Congress still failing to take any action, the newspapers of the country began to largely avail themselves of the facilities offered by railroads and steamboats for the transmission of their papers outside of the mails, and as this practice increased the revenues of the department from newspaper postage were sensibly affected. This was in violation of the existing postal law, and Postmaster-General John M. Niles, in his annual report dated December 5, 1840, called the attention of Congress to the subject in the following words:

Newspapers sent outside the mails.

The greatly enhanced expense of the transportation of the mail on railroads is not the only way in which they affect the revenues of this department. The great facilities which they afford for the transportation of letters and newspapers out of the mail evidently diminished and reduced the postage receipts. This is proved by the sudden falling off of the revenue where these facilities have recently been provided. Information has also been received from the agents of the department, showing that letters, packages, and newspapers were extensively conveyed out of the mails on the railroads, steamboat lines, and many of the stage-coach routes. So far as this practice was detrimental to the income of the department it was believed to be in violation of law. I endeavored to suppress it, regarding it as my highest duty to enforce the laws. The practice of carrying newspapers out of the mails without having secured a provision in the contract I found to be so general that it could not be suppressed without great inconvenience to the public; and as the ambiguity of the law admitted of doubt in regard to the restriction, I concluded that I should best discharge my duty by permitting these practices to continue and leave it to Congress to remove the prohibition or make the law more explicit for its enforcement. As it is probable that the enforcement of the prohibition would have the effect of stopping the carrying of newspapers on the mail routes rather than causing them to be conveyed in the mails, it would seem both just and politic to abolish the restriction entirely.

Postmaster-General Niles also alluded to the inequalities of the existing rates of newspaper postage in the same report as follows :

Inequality of newspaper and letter postage.

The low rates of postage on newspapers and other printed matter originated in considerations of public policy, and were designed to promote the general dissemination of intelligence among the people, and the reasons for this policy, if deemed ever to have been just, have in a great measure ceased to exist. When the mail establishment was first organized printing was confined to the large cities, and there were few other channels for conveying newspapers but the mails. Now there are printing establishments in almost every village, and railroads, steamboats, and other lines of communication afford cheap and convenient channels for conveying newspapers and also other publications, the greater portion of which are distributed among the people without the agency of the mails. * * *

All newspapers now pay the same rates of postage, although some are ten times the dimension and weight of others. This is not only unjust to those who pay the taxes, but equally so to publishers. It gives an undue advantage to the large establishments in the commercial cities over the penny papers in the same place, and over the country newspapers, which are more removed from sinister influences and in general are the most independent channels of sound public opinion. There seems no good reason for the difference in postage between periodical and non-periodical pamphlets, and the distinction, in fact, is often difficult to preserve. By the present law all printed matter, except newspapers, is taxed by the sheet, but by the change in the forms of publication the postage is not and cannot be collected with any uniformity from the difficulty experienced by the postmasters in classing the various publications. Sixteen pages of octavo or twenty-four of duodecimo constitute a sheet, although it is often impracticable to distinguish between them. To remove all of these difficulties, and to establish a uniform rate of postage on printed matter, the best rule would be to tax it by weight; and if there should be an objection to so great a change, newspapers could be divided into three classes, according to their dimensions, on the plan recommended by the Postmaster-General in his report for 1836. To the proposition to tax other printed matter by weight it is believed there can be no objection. Whether the other more important reforms which have been recommended are effected or not, the tariff of postage on newspapers and other printed matter demands a radical change.

The advance of the postage on newspapers and other printed matter, although regarded as eminently just, is not admitted to be indispensable, but the object in view is a revision and an equalization of the tariff.

This report appears to have contained the first official suggestion that the true method of arriving at a just rate of newspaper postage was to tax by weight. Even he advanced the suggestion with timidity so far as newspapers were concerned, although confident there could be no objection to the principle in reference to other printed matter. His suggestion appears to have been derived from the report of Mr. George Plitt, a special agent of the post-office department, who was instructed to make an inquiry regarding the rates of newspaper postage in England and the United States. Mr. Plitt reported as follows :

The plan to base postage upon weight.

Special Agent Plitt's report.

Newspapers are sent free to any part of the British kingdom, provided they are mailed within eight days after they are printed, and all foreign newspapers are charged with postage at the rate of 2d. each. Every newspaper published in England pays a stamp duty of 2d. It would therefore seem scarcely right to tax it again when sent by mail. The average number of newspapers received daily for delivery in the London post-office is 11,460; the average number of newspapers posted in London is 83,510; the average number of newspapers daily distributed and forwarded is 3,000.

The transportation of newspapers, pamphlets, and other printed matter is by far the most burdensome portion of the mails, for which the department receives a very inadequate compensation. The price paid to the contractor is generally in proportion to the weight of the mail, and consequently that portion for which the lowest compensation is received is that for which the highest price is paid for transmission. To remedy this in some measure I would earnestly recommend that newspapers and printed matter of every description should be charged by weight. There is no reason or justice in the present law so far as regards the transmission of printed matter by mail. While one of the smaller newspapers pays as much postage as some of the mammoth sheets published in New York and elsewhere, which are perhaps 6 feet square, it is positively unjust to the publishers, the public, and the mail service. If newspapers were charged by weight, both the public and the department would be benefited by the change, for the publisher would surely be careful to see that every paper should be well dried before it was sent to the post-office, thus securing its transmission without being rubbed or defaced; and it would at the same time aid in decreasing the weight of the mails. The postage upon all newspapers should be paid in advance, except when sent to offices within the county, district, or parish within which they are published. In that case they might be sent free. Publishers of newspapers should not be allowed to send their exchange papers free of postage, as at present. As well might the merchants demand from the department a free exchange of their prices current, or any other class of citizens be allowed to send free of postage everything in relation to any particular branch of business in which they might be engaged. As the country extends and increases in population, the attention of the department will necessarily be turned to one great object: the most effectual manner of decreasing the weight of the mails with the least injury to the public, in order that it may be enabled to convey them with the speed that seems to be demanded by the increased wants and enterprise of the country. This cannot be done without lessening the circulation of the newspapers to legitimate and reading subscribers, by excluding from the mails entirely such matter as is now transported from one section of the the Union to another without being taken from the post-office. As evidence of this the following statement of the average number of newspapers remaining uncalled for each week in the post-offices of New York, Philadelphia, Boston, and Baltimore will be sufficient to prove:

New York	750
Philadelphia.....	400
Boston	500
Baltimore	400

The number of periodicals and other publications remaining dead in these post-offices is in about the same proportion. If the postage upon these papers and pamphlets had been paid in advance, the probability is that they would have been called for, or, if not, the States receive a proportionate quantity of dead printed matter respectively, and that all this amount could be culled from the mails by the system of prepayment, what an immense weight at once would be taken away! A newspaper of the size of the *Globe*, *National Intelligencer*, or *Philadelphia Inquirer* will weigh, when dry, without a wrapper, about two ounces. If papers are allowed to go free in the counties where they are published a prepayment of 1 cent per ounce postage would be but a reasonable charge for those sent beyond the limits of the county; for other printed matter of all kinds 2 cents per ounce might be charged for a distance of anything under five hundred miles,

and 3 cents for any distance beyond; this would be a reduction of the present price, and yet the revenues of the department would be augmented. As the one great desideratum is to lessen the weight of the mails, all publishers might be allowed the privilege of sending their newspapers by private conveyance or otherwise, even over the mail-routes.

It will be observed that the newspaper postage law recommended by Mr. Plitt in 1840 is identical, except in the matter of rates, with that now in force in the United States.

The annual report of Postmaster-General C. A. Wickliffe, dated December 2, 1841, called the attention of Congress to a new difficulty growing out of the unsatisfactory condition of the laws with reference to the postage on newspapers, as follows:

Difficulty with publications not newspapers.

I do not desire that the rates on newspapers proper should be increased, though much might be saved the department if the principle of full postage were applied to newspapers, provided such regulations were deemed acceptable to public opinion. I must, however, earnestly invite your attention to the necessity for the enacting of some law by which a just discrimination may be made in the imposition of postage on newspapers proper and those mammoth periodicals which assume the names of newspapers, and which are in fact the republication of books, reviews, and novels, sent through the post-office, not always to subscribers, but in large masses to agents, to vend in the markets of more distant cities and towns, which greatly increase the size and weight of the mails and the expense of transportation without a corresponding remuneration to the department. The great number of these large publications which have been sent by the mails from Baltimore to Wheeling has largely contributed to the frequent irregularity of the western mails.

I respectfully inquire whether it is just that the United States mail shall be compelled to transport one of these newspapers, weighing nearly one pound, for one cent and a half, from Boston or New York to Louisville, Kentucky, to a factor, to sell for the benefit of the book writer, while the letter of friendship or business is taxed 25 cents postage between the same points?

I have already alluded to the establishing of what is called the printers' express, for the carrying of letters, packages, and newspapers upon the post-roads of the United States for pay and compensation, as one cause tending to greatly reduce the revenues of the department. I must beg leave to bring the subject to your notice, in the hope that you will invite the attention of Congress to the necessity of some further legislation to effectually protect the interests of the general government in its post-office department.

Mr. Wickliffe in his next annual report thus reverted to the habit of newspaper publishers of sending their issues outside the mails in violation of the law:

Connected with this subject is the business of transporting newspapers out of the mails over mail roads in violation of law. When applied to by postmasters and contractors to instruct them upon their duties upon this subject, I addressed to the contractors a circular letter, in which I gave them my opinion of what the law of Congress was upon the subject. A copy of that letter accompanies this report. The correctness of the opinion contained in this circular letter has been questioned. I was confident of the facts therein expressed, believing them to be correct, and felt it a public duty to publish them when called for by those to whom the duty of transporting the mails was confided, and am gratified to find my views sustained by the official opinion of the Attorney-General.

Newspaper transmission outside the mails.

The following is an extract from the circular letter above referred to:

Congress, by the act of 1825, has expressly declared that no stage or vehicle which regularly travels trips on post-roads shall convey letters, nor shall any packet-boat or other vessel which regularly plies on a water route declared to be a post-road convey letters.

The thirtieth section of the act of 1825 provides that the Postmaster-General, in any contract that he may enter into, may authorize the person with whom such contract may be made to carry newspapers, magazines, and pamphlets other than those conveyed in the mails, provided no preference shall be given to one publisher over another in the same place. The practice has grown up of sending newspapers on the cars and steamboats that transport the mails. This is a right claimed by some editors, and others have addressed letters to their subscribers inviting them to receive their papers in that way in preference to the mails.

This is a subject which has given rise to no small portion of abusive denunciation of the head of this department. This right is called for by the cheap penny papers, as they are called. The laws of Congress have made no distinction between newspapers. The postage is imposed upon all newspapers, regardless of their size. It applies to all alike, and all must share the same fate in the mails. It is true the act of 1825 has authorized the Postmaster-General, in making the contracts for carrying the mails, to authorize the contractor under certain conditions to carry newspapers out of the mails. Without such permission no such right exists, and the contractor who carries them violates his contract with the government. Such a privilege upon many of the railroads and steamboat routes would no doubt be advantageous alike to the publisher and public, but it must be granted upon application and specific terms.

If, therefore, any publisher wishes to convey newspapers on your line out of the mail, he should make application to you, stating the name and number of the papers, daily or otherwise, and upon your report of application to this department the terms upon which it can be done will be made known, which terms will be applicable to all other papers. You are requested to report to this department, when known to you or your agents, monthly, the name and number of newspapers which are daily transported over your line by way agents, out of the mail, and between what places.

The long agitation of the subject led finally to a revision of the postal laws in 1845. Under the act of March 3 of that year the following rates of postage were adopted: For a letter not exceeding one-half ounce in weight, under 300 miles, 5 cents; over 300 miles, 10 cents; and an additional rate for every additional half ounce or fraction thereof. Pamphlets, magazines, etc., per ounce, 2½ cents, and each additional ounce 1 cent. Newspapers under 30 miles, free; over 30 and under 100, or any distance within the state where published, 1 cent; over 100 miles and out of the state, 1½ cents. Carriage by express was prohibited unless the postage was previously paid. It will be seen that while the letter postage was very considerably reduced by this act, newspaper postage remained the same as it had been from the organization of the government, except that all newspapers were carried free for 30 miles from the place of publication. The principle of charging by weight was applied to all periodicals and pamphlets under this law, which resulted in a very considerable increase in the cost of their transmission by mail. The details of the law of 1845, respecting the mailing of newspapers, were contained in the following extract:

Postal law of 1845.

Extracts from the law of 1845.

SEC. 2. That all newspapers of no greater size or superficies than 1,900 square inches may be transmitted through the mails for the delivery and be delivered to all subscribers or other persons, within 30 miles of a city or town or other place in which the paper is or may

be printed, free of all charge for postage whatever. And newspapers of and under the size above stated which shall be conveyed in the mail beyond 30 miles from the place where the same shall be printed shall be subject to a rate of postage chargeable upon the same under the thirtieth section of the act of Congress approved March 3, 1825; and upon the newspapers of greater size and superficial extent than 1,900 square inches there shall be charged the same rates of postage which are prescribed by this act to be charged upon magazines and pamphlets.

Referring to the act of 1845, Postmaster-General Johnson, in his annual report, dated December 1, 1845, said:

Postmaster-General Johnson upon the law of 1845. A discrimination has been made in behalf of newspapers and other printed matter because they are supposed to advance the policy of the government by contributing to the general diffusion of intelligence among the people, upon which depends the maintenance and perpetuation of our free institutions.

There was under the old law a great difference in the tax upon letters and printed matter; the tax upon the former was unnecessarily high and became oppressive to the citizens, while the tax upon the latter was not so high as materially to interfere with their general circulation.

There are returns made of the weight of the different kinds of matter passing through the mails, upon which an opinion might be formed of the actual cost of the different kinds, or the proportion each should pay. One of my predecessors had an account kept in 1838 for one week of the weight of the mails, distinguishing between the weight of letters, newspapers, and pamphlets in the cities of New York, Philadelphia, Baltimore, Washington, and Richmond, from which it appears that the whole weight of the mails was 55,241 pounds, of which the newspapers weighed 48,868 pounds, the periodicals 8,857 pounds, letters (free and taxable) 1,916 pounds. It is confidently believed that the difference in weight between printed matter and written communications passing through the mails is greater since the passage of the late law than before; that nine-tenths of the whole weight of the mails, and a greater inequality in bulk, is composed of printed matter, paying about one-ninth of the expense. This great inequality in the cost of transportation did not warrant the difference of postage under the former law, and was most unjust to the friendly and business correspondence of the country. The reduction of letter postage by the late law was but an act of justice to that class of our citizens which had been so long and oppressively taxed for the benefit of others. The same necessity did not exist for the reduction of the rate upon printed matter. This has always been low—greatly below the actual expense of its transportation—and yet not so high as to interfere with the original policy of the government. I therefore recommend the restoration of the former postage upon all printed matter passing through the mails, with the right reserved to publishers to take them out of the mails over post-roads.

I also recommend a limitation of the number of papers editors may interchange free through the mails. There are now understood to be between seventeen and eighteen hundred printing establishments in the United States from which newspapers issue. From this fact alone it will be readily seen what abuses may be practiced upon the departments.

In his next annual report Postmaster-General Johnson returned to the discussion of this subject, again recommending an increase of postage upon printed matter. Alluding to the fact that the revenues of the previous year show a great deficiency, he said:

Increased newspaper postage recommended. I recommend that the postage on newspapers be so adjusted as to approach more nearly the cost of transportation and delivery, and be made more equal and just between the publishers. This may be accomplished without any material interference with the policy of disseminating intelligence among the people by their general circulation.

When this policy was first adopted, newspapers were few in number and were published in the principal cities, and low postage seemed necessary to secure the object of their publication, and the rates were fixed without much regard to the size, or weight, or the distance they were to be transported, while the letter postage was made high, so as to cover the transportation of both. Newspapers are now published in every village throughout the Union and furnish the means of information to almost every neighborhood. This injustice to written correspondence occasioned by taxing it with the transportation of newspapers has been partially removed by the reduction of the rates on letter postage.

From this act of justice an injury has resulted to the community at large by transferring the cost of transporting newspapers upon the general revenues. No satisfactory reason now exists why those who buy or sell newspapers should have the cost of transportation paid by the revenues collected from the great body of the people. The low postage on newspapers, without regard to size, weight, or the distance to be taken, operates unfairly between the publishers themselves, by enabling those papers published in large commercial cities to compete with the village press by circulating in their localities, while sending the papers free for 30 miles from the place of publication counteracts to some extent this advantage, an advantage alike unjust to the editor and unjust to the community, as the burden of both is thrown upon the Treasury.

As an act of justice between the publishers themselves the rate of postage should be regulated by the size and weight of the paper and the distance to be carried, reserving the right to them to take their own papers over mail routes out of the mails. As an act of justice to the community these rates should be so high as to cover any deficiency the reduced rates of postage on letters may make, so as to make the income of the department equal to its expenditures. Transient newspapers other than those sent by the publisher to subscribers, as they are usually sent in lieu of letters, should be rated higher than other newspapers. All printed matter passing through the mail should be prepaid.

In the next Congress after that which effected the reduction of postage an effort was made for the restoration of the old rates, as the postal revenues did not pay the expenses of the department. The effort did not succeed as to letter postage, but transient newspapers were charged 3 cents, prepayment being required; the postage on circulars was raised from 2 to 3 cents; newspaper postage to California and Oregon was fixed at 4½ cents; and letter postage to the Pacific territories at 40 cents. In the meanwhile the revenues from newspaper postage were steadily increasing. The number passing through the mails and the receipts for their carriage are stated in the annual report of Postmaster-General Johnson, dated December 6, 1847, as follows:

The Postmaster-General's report for 1847. The newspapers passing through the mails annually are estimated at 55,000,000; pamphlets and magazines at 2,000,000. The number of transient newspapers paying 3 cents postage cannot be ascertained with any accuracy, as the postage is usually returned with that of letters.

For the year ending June 30 last there was derived from the postage on newspapers, pamphlets, etc., \$643,160 59, making an increase over the previous year of \$81,018 10 and an increase over the annual average of the nine preceding years of \$114,181 61. The total revenues of the department for the same year were \$3,945,893 31.

The postage on newspapers is unequal and unjust to the publishers themselves. The same postage is charged on each paper without regard to weight. Many of the larger class of papers weigh more than $2\frac{1}{2}$ ounces each, and pay but $1\frac{1}{2}$ cents for any distance over 100 miles; and if charged as letter postage would pay under 300 miles 15 cents, and over 300 miles 30 cents. Other papers weigh as low as one-half an ounce, only one-fifth of that weight, and pay the same rates. Some of the larger sized periodicals weigh over $12\frac{1}{2}$ ounces, and pay $14\frac{1}{2}$ cents over 100 miles, and if charged with letter postage would pay under 300 miles \$1 30, and over \$2 60. This inequality of tax on the different publications should be regulated in some way, and no reason exists why the postage on newspapers should not be regulated by weight, as on letters. The weight and bulk of the mails, which add so greatly to the cost of transportation and actually impede the progress of the mails, are, I think, attributable to the mass of printed matter daily forwarded from the principal cities of the Union and from all parts of the country. Justice requires that their transportation should be paid by the postage charged upon them, and it is believed that the present rates would not meet with objection if the postage could be equalized and in all cases collected.

In his report dated December 2, 1848, Postmaster-General Johnson again urged that newspaper postage be regulated by weight, and said:

For the purpose of taxing, the matter conveyed in the mails is classified as follows: First, letters; second, newspapers. The latter class has always been esteemed of so much importance to the public, as the best means of disseminating intelligence among the people, that the lowest rate has always been afforded for the purpose of encouraging their circulation. Heretofore a charge has been made upon every paper without regard to weight, which is unjust to the publisher as well as to the public, and there is no satisfactory reason why they should not be charged by weight as well as letters and other sealed packages. This would lead to a discontinuance of the practice of depositing newspapers in the mails before they are dry, which renders them more liable to injury, and their weight is greatly increased by the dampness of the paper. A uniform rate of 1 cent upon each ounce or fraction of an ounce would be more just and proper, while at the same time it would yield as much revenue as the present rates. Third, all other printed matter of whatever nature or kind should be rated with double newspaper postage.

In the report of Postmaster-General Collamer, of November 19, 1849, is the following:

To exhibit separately the increase in the revenue derived from letter postage and printed matter the following comparison is instituted:

	Year ending June 30, 1848.	Year ending June 30, 1849.	Rate of increase.
Letter postage, including stamp sales....	\$3, 350, 304	\$3, 882, 762	Per cent. 15. 9
Newspaper and pamphlet postage.....	767, 335	819, 016	6. 7
Aggregate	4, 117, 639	4, 701, 778	14. 2

The whole number of letters passing through the mails charged with postage amounted last year to 62,000,000. On all these letters the postage collected was \$3,882,762; on newspapers and pamphlets, \$819,016. It is well known that the postage on newspapers and pamphlets, in proportion to their weight and numbers, is in a very great degree less than the letter postage, so that they did not pay their proportion of the expenses of the service. It therefore follows that the letter postage pays not only for its own cost, but also what the newspaper postage falls short of its proportion. It is not to be understood, however, that any increase of newspaper postage is proposed. It has long been regarded as a sound public policy to promote the circulation of these publications by cheap postage, and it may be advisable to proceed further in this policy, especially with a view to increasing their circulation in the vicinity of publication, provided no decided injustice be done in that same vicinity.

Postmaster-General N. K. Hall, in his report dated November 30, 1850, stated that "the gross revenue of the department for the year ending June 30 was \$5,552,971 48, of which the amount received from newspaper and pamphlet postage was \$919,485 94". After recommending that the provision which imposed an additional half-cent postage upon newspapers sent more than 100 miles, and out of the state where they were mailed, be repealed, so as to leave the uniform inland postage on newspapers sent to subscribers from the place of publication at 1 cent each, he continued:

The postage upon pamphlets, periodicals, and other printed matter, except newspapers, may be simplified and somewhat reduced with advantage to the department. Two cents for the pamphlet or periodical of the weight of two ounces or less, and 1 cent for each additional ounce or fraction of an ounce, is recommended as the inland rate upon all pamphlets, periodicals, and other printed matter, instead of the present rate of $2\frac{1}{2}$ cents for the first ounce, and 1 cent for every additional ounce or fractional part of an ounce. The sea-going charge on such matter and on newspapers, twice the inland rates to and from the points to which it is proposed that the letter postage shall be 10 cents and four times the inland rate where the letter rate is 20 cents, is deemed a just and proper rate. This would, in some cases, increase the postage on printed matter sent to the Pacific coast and by other sea lines where the postage is not fixed by postal arrangements. But the postage to California, as above proposed, would hardly equal the price now charged by private expense for the conveyance of the same weight. It will be perceived that the reduction proposed in the postage on printed matter is not large. The reason for the proposed reduction on letter postage is found in the fact that the rates upon printed matter are now exceedingly low when compared with letter rates. The average postage on letters is estimated at about \$3 16 per pound, and on newspapers and pamphlets at about 16 cents per pound. After the reduction proposed the average inland postage on letters will be about \$2 50 per pound when not prepaid and \$1 50 per pound when prepaid.

In 1851 another postal law was enacted which reduced letter postage to 3 cents (one-half ounce) for all distances under 3,000 miles, or 5 cents if not prepaid; weekly newspapers, where published in the county, to actual subscribers, free; under 50 miles and out of the county, 5 cents a quarter; over 50 and under 300 miles, 10 cents; over 300 and under 1,000 miles, 15 cents; over 1,000 and under 2,000 miles, 20 cents; over 2,000 and under 4,000 miles, 30 cents. Monthly newspapers one-quarter, and semi-monthly one-half these rates; semi-weekly double, tri-weekly treble, and oftener than tri-weekly five times these rates; newspapers under 300 square inches, one-quarter these rates; if paid quarterly in advance, a deduction of one-half

to be made from these rates. Transient newspapers, circulars, and other printed matter, 1 cent an ounce under 500 miles; over 500 and under 1,500 miles, 2 cents; over 1,500 and under 2,500 miles, 3 cents; under 3,500, 4 cents; over 3,500, 4 cents. Books under 32 ounces, 1 cent an ounce if prepaid; if not, 2 cents an ounce.

In 1852 the following modifications were made: Letters sent over 3,000 miles and not prepaid, 10 cents postage; newspapers, circulars, etc., under 3 ounces, 1 cent; every additional ounce or fraction, 1 cent; small newspapers and periodicals, published monthly or oftener, and pamphlets of not more than 16 octavo pages, sent in single packages of not less than 8 ounces, prepaid, one-half cent an ounce, or if not prepaid, 1 cent. Books, bound or unbound, less than 4 pounds, under 3,000 miles, 1 cent an ounce; over 3,000, 2 cents an ounce; 50 per cent. added when not prepaid. By the act of the same year postage-stamps and stamped envelopes were ordered.

Postmaster-General James Campbell commented as follows upon these changes in his annual report for 1854:

Under the act in operation prior and up to July 1, 1851, the postage, for instance, on a weekly newspaper when sent not over 100 miles or any distance in the state where published, was 13 cents, and when over 100 miles and out of the state where published, 19 cents a quarter. By the act of 3d March, 1851, these different rates, according to distance, were abolished.

Thus on a weekly newspaper for any distance not exceeding 50 miles, 5 cents per quarter; over 50 miles and not exceeding 300 miles, 10 cents; over 300 miles and not exceeding 1,000 miles, 15 cents; over 1,000 and not exceeding 2,000 miles, 20 cents; over 2,000 and not exceeding 4,000 miles, 30 cents a quarter; and weekly newspapers to the subscribers in the county where published were made free.

By this act the postage, it will be perceived, for any distance not over 1,000 miles was greatly reduced; but owing to the diversity of rates, the too great reduction for the shorter and too great increase in the longer, its modification was at once called for, and this resulted in the present law, by which the quarterly rates on any weekly newspaper or periodical not exceeding 3 ounces in weight sent any distance in the United States is only 6½ cents. On newspapers not exceeding 1½ ounces in weight, when circulated in the county where published, the rate is 1½ cents less, being only 3½ cents; but a weekly newspaper to subscribers in the county where published goes free.

If my recommendation be adopted, the quarterly postage, for instance, on weekly newspapers or periodicals not exceeding 1½ ounces in weight, circulating in the state where published (and in the same proportion for more frequent publications), would be 6½ cents; and when not over 3 ounces in weight, and not published in the United States, 13 cents a quarter; newspapers sent to subscribers living in the county where published will continue to go free.

The recommendation of the Postmaster-General above referred to was as follows:

In view of the trifling increase of postage on printed matter and the extremely low rates, particularly for newspapers and periodicals, I would recommend that the law be so far changed as to omit the clause, "When the postage on any newspaper or periodical is paid quarterly or yearly in advance one-half only of the regular rates shall be charged," leaving the department to fall back upon the act of 1825, under which quarterly payments in advance on newspapers and periodicals have heretofore always been required.

In his report for 1859 Postmaster-General Holt attacked with great vigor the long-existing practice of permitting newspaper publishers to receive their exchanges in the mail free of postage, and he declared this practice to be an unjustifiable discrimination in favor of a particular class. He also denounced the more recent custom of free postal delivery in the county of publication, as follows:

The revenue of the office was \$7,968,484 07, of which was received from the postage on newspapers and pamphlets \$589,352 39.

The act of 1825 authorized every printer of a newspaper to send one paper to each and every other printer of a newspaper in the United States free of postage. And such is the existing law. However slight the support this statute may seem to give to the individual publisher, it imposes in the aggregate a heavy and unjust burden upon the department; and though it is thus twice generous to the publisher who sends and he who receives the paper in exchange, I have ineffectually sought an explanation of the policy indicated by this provision. It seems far more questionable than the franking privilege, since the latter assumes to be exercised on behalf of the public, whereas the exemption secured by the former is undoubtedly in the advancement of a particular interest. The newspapers received by the journalist is, in American parlance, his stock in trade. From their columns he gathers materials for his own, and thus makes the same business use of them as does the merchant of his goods or the manufacturer of the raw material which he proposes to manufacture into fabric. But as the government transports nothing free of charge to the farmer, merchant, or mechanic to enable them to prosecute successfully and economically their different pursuits, why should it do so for the journalist? If the latter can rightfully claim that his newspaper shall thus be delivered to him at the public expense, why may he not also claim that his stationery and type, and indeed everything which enters into the preparation of the sheet he issues as his means of living, be delivered to him on the same terms? It has been alleged, I am aware, and merchant pay on the newspaper for which they subscribe; yet it is paid by them uncomplainingly. If it should be insisted that the publishers of newspapers, as a class, are in such a condition as to entitle them to demand the aid of the public funds, it may be safely answered that such an assumption is wholly unwarranted. Journalism in the United States rests upon the deepest and broadest foundation, and has here won a career far more brilliant and prosperous than in any other nation in the world. The exceedingly reduced rates at which its issues pass through the mails secure to it advantages enjoyed under no other government. Under the fostering care of the free spirit of the age it has now become an institution of this country, and controls the tides of the restless ocean of public opinion with almost resistless sway. It is the *avant courier* of the genius of our institutions, and is everywhere the advocate of progress and of the highest and noblest feelings of human freedom. Is it not, therefore, to the lowest degree unseemly, if not worse, that in its own interests, and in the furtherance of its own pecuniary gain, it should claim permission to violate habitually a great principle of which it is the standing advocate, and which underlies our whole political system—the principle of equal rights to all and especial privileges to none? If, however, from the grandeur and beneficence of its mission, the press is to be exempted from the operation of this wholesome democratic doctrine, and is to be subsidized to the extent of its postage to the government, then undeniably such a subsidy should be contributed from the general treasury instead of being imposed, as at present, upon the revenues of the post-office department, which under all circumstances should be deemed inviolable. Into the same category, but for more cogent reasons, must follow that class of weekly papers which the statute of 1852 requires shall be delivered free of postage to all subscribers residing within the limits of the county in which they are published. This requirement is less sound on the score of principle than the discrimination in favor of the press in the matter of newspaper exchanges. There may be something in the characteristics of the latter, ennobling as it is as an organ of the intellect and heart of the millions of freemen, which may induce many to grant to it especial and distinguished immunities; but why a citizen who chooses to reside on one side of a county line shall be exempt from the postage on his newspaper, when his neighbor on

the other side of the line is obliged to pay on the same paper, surpasses my comprehension. There would be more reason for exempting letters from charge while circulating through the mails within the county in which they are written, because, being much lighter than newspapers, their transportation burdens the department less. Could contractors be found sufficiently public-spirited to transport this class of newspapers without compensation, then indeed gratuitous delivery might be claimed of the department as a reasonable duty. But precisely the same rate of compensation is demanded to pay for this as for every other postal service, and hence this privilege is in fact a donation of so much of the postal revenues as the service costs.

Postmaster-General Montgomery Blair, in his annual report dated December 2, 1861, thus referred to certain abuses of the postal service by publishers, and recommended a new legal definition of the meaning of the word "newspaper":

By existing law, section 16 of the act approved March 3, 1845, "newspapers" are declared to embrace printed matter issued by the press and published monthly, and are entitled to the same privilege of free exchange and low rates of postage as daily and weekly newspapers enjoy. It is ascertained that this classification is abused by the publication of monthly issues of printed matter, chiefly designed as advertising circulars from exchanges, for the proprietor, and are often sent gratuitously.

I recommend that the definition of a newspaper as given by that act be amended by the substitution of the words, "Published at short stated intervals of no more than one week," for the words, "Published at short stated intervals of no more than one month." And also that the privilege of free exchange of publications be limited to newspapers thus defined, and to religious, literary, and educational periodicals published not less frequently than once a month.

It is found that considerable fraud is perpetrated on the revenues of the department by publishers of newspapers, who include, mingled with the packages sent to their regular subscribers, numbers of issues which are not regularly sent to their subscribers, and which are therefore subject to pass without postage.

To remedy this evil, I recommend that discretion be given to the head of this department to exclude temporarily from the mails any newspaper or periodical whose proprietor or agents shall send any of their issues without prepayment of postage to other than *bona fide* subscribers, or otherwise that an express penalty be imposed for such act.

During Mr. Blair's administration of the post-office department there occurred several events in connection with the relations of that department to the newspaper press of which no mention is made in the official reports of the department, but which nevertheless have a most important bearing upon this investigation. They recall the excitement created under the administration of Andrew Jackson, in reference to the transmission of "incendiary newspapers" through the mail. The circumstances surrounding the exercise of federal authority to exclude certain publications from the mails in 1861 and in subsequent years were widely different from those existing in 1835, owing to the actual existence of a state of war. On the 16th of August, 1861, the grand jury of the city of New York "presented" certain newspapers published in that city to the circuit court of the United States, on the ground that they contained treasonable utterances calculated to aid and comfort the enemy. This presentment read as follows:

To the circuit court of the United States for the southern district of New York:

The grand inquest of the United States of America for the southern district of New York beg leave to present the following facts to the court, and ask its advice thereon:

There are certain newspapers within this district which are in the frequent practice of encouraging the rebels now in arms against the federal government by expressing sympathy and agreement with them, the duty of acceding to their demands, and dissatisfaction with the employment of force to overcome them. These papers are the New York daily and weekly *Journal of Commerce*, the daily and weekly *News*, the daily and weekly *Day Book*, the *Freeman's Journal*, all published in the city of New York, and the daily and weekly *Eagle*, published in the city of Brooklyn. The first named of these has just published a list of newspapers in the free states opposed to what it calls "*the present unholy war*"—a war in defense of our country and its institutions and our most sacred rights, and carried on solely for the restoration of the authority of the government.

The grand jury are aware that free governments allow liberty of speech and of the press to its utmost limit. If a person in a fortress or an army were to preach to the soldiers submission to the enemy he would be treated as an offender. Would he be more culpable than the citizen who, in the midst of the most formidable conspiracy and rebellion, tells the conspirators and rebels that they are right, encourages them to persevere in resistance, and condemns the effort of loyal citizens to overcome and punish them as an "unholy war"? If the utterance of such language in the streets or through the press is not a crime, then there is a great defect in our laws or they were not made for such an emergency.

The conduct of these disloyal presses is of course condemned and abhorred by all loyal men, but the grand jury will be glad to learn from the court that it is also subject to indictment and condign punishment.

CHARLES GOULD, *Foreman*.

On the strength of this action of the grand jury the following order was promulgated from Washington:

POST-OFFICE DEPARTMENT, August 22, 1861.

SIR: The Postmaster-General directs that from and after your receipt of this letter none of the newspapers published in New York city which were lately presented by the grand jury as dangerous, from their disloyalty, shall be forwarded in the mails.

I am, respectfully, your obedient servant,

WILLIAM B. TAYLOR,
Postmaster of New York City.

T. B. TROTT, *Chief Clerk*.

The postmaster of New York also received orders from Washington in August, 1861, that no more copies of certain papers in or near New York should be sent through the mails. (a)

^a In addition to the post-office department, the war department and department of justice used their authority for the suppression of sundry newspapers, or of particular issues thereof, which published matter adjudged to be treasonable.

By an order issued from the war department at Washington, newspapers publishing military intelligence, however obtained and by

In his annual report for 1865 the Postmaster-General announced that—

New stamps have been adopted of the denomination of 5, 10, and 25 cents for prepaying postage of packages of newspapers forwarded by the publishers or news dealers under the authority of law, whereby a revenue will be secured hitherto lost by the department.

In his annual report dated November 15, 1869, Postmaster-General Creswell detailed some of the objectionable features of the then existing postal laws with reference to the transmission of newspapers, and substantially recommended the features of the law as it now stands:

Postmaster-General
Creswell recommends the
existing law.

The department is defrauded out of a large amount of postage on newspapers by parties who, while professing to be sending out papers from known offices of publication to regular and *bona fide* subscribers, are in fact loading the mails with specimen papers and mere business circulars disguised in the form of newspapers. The act of March 3, 1863, and the regulations made in pursuance thereof, require that all such matter, if sworn from the mailing office, shall be sent to the office of

whatever means received, not authorized by the official authority, were excluded thereafter from receiving intelligence by telegraph or transmitting their papers by railroad. The following is a record of some of the newspaper suppressions by federal authority:

August 15, 1861, at Saint Louis, Provost Marshal McKinstry suppressed the publication of the *War Bulletin* and the *Missourian*.

August 26, 1861, a company of federal troops took possession of the *Northwest Democrat*, published at Savannah, Missouri. The *Democrat* boldly carried at the head of its columns the name of Jefferson Davis for President and of Claiborne F. Jackson for Vice-President.

On the arrival of the New York train at Philadelphia on the morning of August 22, 1861, Marshal Millward and his officers examined all the bundles of papers and seized every copy of the *New York Daily News*. The sale of this paper was suppressed in that city. Marshal Millward also seized all the bundles of the *Daily News* at the express offices for the West and South, including over 1,000 copies for Louisville and nearly 500 copies for Baltimore, Washington, Alexandria, and Annapolis.

In Philadelphia, Pennsylvania, August 23, 1861, United States Marshal Millward proceeded to the office of the *Christian Observer*, in Fourth street below Chestnut, and took all the type, paper, and other appurtenances of the place. He also closed up the office, and warned the persons conducting the *Observer* that on any attempt to revive the publication they would be dealt with according to law.

The *Stark County* (Ohio) *Democrat*, Canton, was destroyed by federal troops August 24, 1861.

The *Jeffersonian*, West Chester, Pennsylvania, was suspended by Deputy United States Marshal Schuyler, August 24, 1861.

The *True American*, Trenton, New Jersey, suspended August, 1861, giving as its reason for the act that the national authorities had virtually interdicted the publication of every paper that did not support the government and administration.

February 17, 1862, the *Mississippi*, the *Organ Democrat*, at Los Angeles, and *California Star* were suppressed from the mails on the ground that they had been used for the purpose of overthrowing the government and giving aid and comfort to the enemy then at war against the United States.

The *New Orleans Bee* was suppressed May 16, 1862, for publishing an elaborate though covert argument in favor of the cotton-burning mob. Publication resumed May 30.

The *New Orleans Delta* was suppressed May 16, 1862, for discussing the cotton question in a manner which violated the terms of the proclamation of May 1, taken possession of, and published by United States authorities.

The *New Orleans Crescent* was suppressed May 13, 1862, by order of General Butler.

Edmund Ellis, publisher of the *Boone County* (Missouri) *Standard*, was tried March 31, 1862, before a military commission at Columbus, Missouri, on two charges: First. The publication of information for the benefit of the enemy, and encouraging resistance to the government and laws of the United States; second. Violation of the laws of war by publication, within the lines of the troops of the United States, in a public newspaper, of articles and information intended and designed to comfort the enemy and invite persons to rebellion against the United States. One of the criminal publications was styled "Letters from the Army"; another, "Root, Abe, or Die;" a third, "News from General Price."

The commission found the prisoner guilty of the charges and specifications, and sentenced him to be placed and kept outside of the lines of the state of Missouri during the war, and that the press, types, furniture, and material of the printing office of the *Boone County Standard* be confiscated and sold for the use of the United States. General Halleck approved the finding and sentence, and directed the printing office to remain in charge of the quartermaster until further orders; that the prisoner be placed outside the state of Missouri, and that if he returned during the war without permission he be arrested and placed in close confinement in the Alton military prison. The proceedings being returned to the war department, they were approved by the Secretary, and an order was issued that the form of procedure should be adopted in like cases by the commanders of all the military departments.

These minor suppressions were followed in 1864 by the government suspension of the *New York World* and the *New York Journal of Commerce*, both of which journals had been deceived into the publication of a forged proclamation of the President calling for more troops. By order of the President the editors and publishers of these journals were imprisoned in Fort La Fayette, and their respective newspaper offices were seized and occupied by military guard and the publication thereof suspended. The occupation and suspension continued for two days and three nights.

The generals commanding the Union armies frequently issued orders relating to the correspondents and the publication of military intelligence. The representatives of the newspaper press held a consultation with General McClellan, by his special invitation, at Washington, August 5, 1861, when it was unanimously decided that the following suggestions from him be transmitted to the editors of all the newspapers in all the loyal states and the District of Columbia:

1. That all such editors be required to refrain from publishing, either as editorial or as correspondence, any description, from any point of view, of any matter that might furnish aid and comfort to the enemy.
2. That they be also requested and earnestly solicited to signify to their correspondents here and elsewhere their approval of the foregoing suggestion, and to comply with it in spirit and letter.

It was resolved that the government be respectfully requested to afford the representatives of the press facilities for obtaining and immediately transmitting all information suitable for publication, particularly as touching engagements with the enemy.

General Rosecrans issued the following card to the press, dated Clarksburg, Virginia, August 20, 1861:

"The general commanding the army of occupation in western Virginia and the department of Ohio invites the aid of the press to prevent the enemy from learning through it the position, strength, and movements of the troops under his command. Such information is of the greatest service to the enemy, and deprives the commander of our own forces of all the advantages which arise from the secrecy of concentration and surprise. These advantages are constantly enjoyed by the rebels, whose press never betrays them."

General McClellan sent the following dispatch to the war department in 1862:

"I find some of the newspapers publish letters from their correspondents with this army giving important information concerning

delivery, with the editor's order, at newspaper rates, but letter rates shall be charged by way of fine for fraud, and shall be collected at the office of delivery. If not paid for and delivered, it often happens that no other disposition of the matter can be made than to return it to the mailing office for the prosecution of the offender. The double transfer thus incurred is frequently attended with no result except that the matter is left in the office and ultimately sold for waste paper. For this mischief there is but one adequate remedy, and that is to require prepayment on all printed matter.

A due regard to the convenience of the publishers of newspapers would require that postage on newspapers should be charged according to the weight of the packages. To accomplish this reform a considerable reduction of present rates might be conceded by the department. To make the remedy of prepayment complete it would be necessary furthermore to confer ample power on postmasters at mailing offices to open and inspect suspicious packages of newspapers, and to impose upon them, if found to be vitiated by fraud, full letter postage, to be paid invariably in advance. This summary proceeding should not relieve the offender from liability to the imposition of the fine already provided for by law.

In his next annual report Postmaster-General Creswell more elaborately outlined his plan for the collection of newspaper postage as follows:

In my report for 1869 I had the honor to suggest a plan for the prepayment of postage on newspapers and other matter of the second class by weight of packages rather than by the present system, which requires the manipulation of each particular paper and allows the payment of postage either at the mailing office or at the office of delivery. The prepayment of newspaper postage.

A careful revision of the subject confirms me in the opinion that the postage on all such matter should be collected in advance at the mailing office. Collections are now made with great difficulty, and there is no provision whatever by which dishonesty or negligence can be dealt with. No stamps are used for the payment of such postage, and the department is compelled to accept in full satisfaction whatever sums of money postmasters choose to charge against themselves. So execrably bad is this system that postmasters of high standing have assumed that no more than one-third of the postage probably charged on newspapers is accounted for and paid over.

Furthermore, disputes are continually arising between postmasters and publishers as to whether the issues they transmit come within the meaning of the term newspaper, and as to the number of their *bona fide* subscribers.

In the hope of contributing to a more faithful collection of postage, of a more prompt and efficient transmission of newspapers, and save the labor in post-offices to the general advantage of the department and the publishers and their patrons, I respectfully submit the following plan for prepayment of second-class matter and urge its adoption:

Let the publishers, or their business managers or agents, at the beginning of every quarter state under oath that after diligent inquiry they are satisfied that they will send in the mails to regular subscribers during the coming quarter no more than ——— copies of the newspaper known as the ——— (giving the number of copies and name of newspaper), and let them be further required to pay in advance the postage prescribed by law, taking therefor duplicate receipts, one of which shall be transmitted to the post-office department; and to afford reasonable opportunity for an increase of circulation during the quarter, let the oath taken at the beginning of the next quarter embrace all the additional copies for the last one, as well as the number to be sent during the then commencing quarter. On the other hand, let the postmasters be required to return, within two weeks after the beginning of every quarter, regular lists of all newspapers addressed to regular subscribers and dispatched in the mails from their respective offices, stating the number of copies of each newspaper and the average weight per paper, the number of issues per quarter, and the amount of money paid as postage therefor.

Payment having been made in advance for the quarter, no stamp or manipulation would be needed, but when received into the office every paper answering to the description given in the receipt would be treated as paid. The papers of persons subscribing after quarter day would be forwarded immediately and paid for at the next quarter. So marked would be the improvement in the collections under this plan that I believe the department could safely consent, in case of its adoption, to the reduction of newspaper rates to 40 per cent. of the present postage. At a reduced rate I am satisfied the department would realize more revenue than now. I also believe that so great would be the saving of labor to newspaper proprietors in the preparation of their papers for the mail, and so decided their gain from the swifter dispatch and freedom from mistakes in transmission and delivery, that they would find the new plan more advantageous to them than the present one. A similar plan could be adopted for magazines and periodicals of the second class.

our movements, position of troops, etc., in positive violation of your orders. As it is impossible for me to ascertain with certainty who these anonymous writers are, I beg to suggest that an order be published holding the editors responsible for its infraction."

The frequent transmission of false intelligence and the betrayal of the movements of the Army of the Potomac by publication of injudicious correspondence of an anonymous character made it necessary for General Hooker, in May, 1863, to issue general orders requiring all newspaper correspondents to publish their communications over their own signatures.

The vicissitudes of the southern press during the civil war were necessarily of an extreme character, and the historian who supplies the chapter in the history of American journalism which details the experiences of newspaper publishers in the southern states from 1861 to 1865 will add interesting details now almost wholly lacking. Many of the oldest and best newspapers of the South disappeared, and have not since been revived. Others continued their issues, even when reduced to the extremity of printing brief news statements on the back of common wall-paper. Rev. Henry Cotton relates the following episode, which illustrates the experience of a number of southern newspapers:

"A confederate states newspaper, originally called the *Memphis Appeal*, has been repeatedly compelled, by the fortune of war, to change its place of publication. On each occasion it has added the name of the new place to its title. This, when last heard of, was the Memphis-Hernando-Grenada-Vicksburg-Jackson-Atlanta-Griffin *Appeal*."

In many of the southern states exceptions were made in favor of newspaper editors in the conscriptions. The governor and executive council of South Carolina adopted the following resolution, March 18, 1863:

"Resolved, That the editors and owners of newspapers in this state be informed that if any of their employes shall fall under the conscription the adjutant and inspector-general will be instructed to withhold from confederate service such of said conscripts as the editor or owner of such newspaper shall declare by affidavit to be absolutely necessary to carry on their respective establishments, and that the work cannot be done by workmen within their command or otherwise exempt: *Provided*, The number withheld shall not exceed seven for the Charleston daily papers, five for the Columbia daily papers, and two for each country paper: *And provided*, The conscripts withheld from confederate service shall be subject to be detailed to such local and special duty as may not seriously interfere with the business of their respective offices."

The Virginia legislature enacted a law exempting newspaper men from military duty. The bill exempted "one editor of each newspaper now being published in the state, and such employes as the editor or proprietor may certify on honor to be indispensable for conducting the publication of the newspaper, so long as the same is regularly published at least once a week".

These suggestions were embodied in the law by an act of Congress approved June 23, 1874; and after nearly three-quarters of a century of unequal, unsatisfactory, and illogical regulation of the subject the government of the United States finally put in operation a system of newspaper postage which is believed to be as rational in its theory and as satisfactory in its operation as any in existence in the world. Under this system newspaper postage is paid by weight, without reference to the distance carried, and is paid uniformly in advance at the office of publication. The government thus receives compensation for every pound of newspaper mail it transmits, and the burden of the cost of transmission is thrown upon the publisher, instead of the subscriber. In his report for 1874 Postmaster-General Marshall Jewell thus detailed the features of the new law with reference to newspaper postage:

The postal law of 1874.

Postmaster-General Jewell on the law of 1874.

By an act of Congress approved June 23, 1874, it is required that on and after the 1st day of January, 1875, postage on newspapers, periodicals, and publications mailed from a known office of publication or news agencies, and addressed to regular subscribers or news agents, shall be charged at the rate of 2 cents per pound if issued weekly or oftener, and at 3 cents per pound if issued less frequently than once a week. The act provides that the matter shall be weighed in bulk, and prepaid with adhesive stamps, to be especially devised for the purpose. The manner of applying the stamps is left discretionary with the department, and a system, which it is hoped will work satisfactorily, has been devised for carrying the law into effect. It is expected that the revenues of the department from the postage on printed matter will be increased by the enforcement of this act, notwithstanding the rates are cheaper than before, as now the postage will be prepaid, while heretofore much loss has been occasioned to the department on account of the non-collection of postage at the point of delivery.

In his next annual report, dated November 15, 1875, Mr. Jewell gave the following account of the satisfactory working of the new law:

The working of the law of 1874.

The act of June 23, 1874, requiring prepayment in stamps of postage on newspapers and periodical publications mailed from known offices of publication or news agents, and addressed to regular subscribers or news agents, went into effect on the 1st of January, 1875, and from present indications it will realize about \$1,000,000 for the first calendar year. This is not a material variation from the average results of the old law, though during the last year in which this law was in operation the amount was increased by the payment of postage on newspapers circulating within the county where published—a requirement which was discontinued at the end of one year.

While, therefore, there has been no increase in the aggregate receipts, there must be a large net gain in the saving of commission on collections allowed by the old law, as under the present law the great bulk of postage is paid at the large offices, whose salaries are not affected by this item. Under the old law there was no check to insure the collections at the office of destination, and the consequence was that much matter went unpaid to its destination that under the present more equitable mode of universal collections have made up for the reductions in the rate.

The new system is working so admirably, and has given such general satisfaction, that no change is deemed necessary. Full information as to the manner of executing the law, with more specific statements of its results, will be found in the accompanying report of the Third Assistant Postmaster-General.

The report of the Third Assistant Postmaster-General to his chief in 1875 gave further details of the methods adopted by the department for the carrying out of the provisions of the law, as follows:

Method of executing the law of 1874.

On the 1st day of January, 1875, the new law requiring prepayment of postage by stamps on all newspapers and periodicals sent from a known office of publication to regular subscribers through the mails went into operation.

The system inaugurated to carry the law into effect was perfected by you in October, 1874, and has been found by experience to be admirably adapted to the purpose for which it was devised. No complaints of abuse on the part of publishers or postmasters have been received at this office during the nine months that have elapsed since the law went into effect. Indeed, it has worked so well in all its details, and has given such general satisfaction, that the idea of returning to the old system or materially modifying the new one should not be entertained.

Previous to the time when this law began to operate no stamps were required for the payment of postage on newspapers sent to regular subscribers, as the postage was collected in money quarterly at the office of delivery. Last year there were 3,500 post-offices at which newspaper postage was collected, while under the present true system of the absolute prepayment of all postages the whole amount is collected at about 3,400 offices, the latter representing the places in the United States at which newspapers and periodicals are mailed.

The papers for subscribers living outside the county in which they are published are made up in bulk at the publication office, carted to the post-office, and there weighed. The postage is computed on the whole issue, the proper amount in stamps is handed to the postmaster, who gives the publisher a receipt as evidence of payment, and on the stubs of the receipt book he affixes a cancellation stamp which corresponds in value with the sum mentioned in the receipt. Thus one transaction is all that is required in paying the postage upon a single issue of any regular edition. The stubs, with their canceled stamps, are kept in the post-office as vouchers for the postage paid. In no case are the stamps affixed to the papers or packages which pass through the mails. These stamps are twenty-four in number. The denominations are: 2, 3, 4, 6, 8, 9, 10, 12, 24, 36, 48, 60, 72, 84, and 96 cents, \$1 92, \$3, \$6, \$9, \$12, \$24, \$36, \$48, and \$60. These denominations were found to be necessary, in order that payment might be made on any given quantity, from one pound to one ton, at both the two and three cent rate, with the use of not to exceed five stamps in any transaction.

The report of the Third Assistant Postmaster-General for the year 1876 shows that the issue of newspaper and periodical stamps for the previous year was 1,290,347, valued at \$945,254 75. There was a decrease of \$12,956 24, or 4.50 per cent., in ordinary newspaper wrappers, and \$171,138 75, or 20.49 per cent., in official postage stamps.

The following is from the annual report of Hon. D. M. Key, Postmaster-General, dated November 9, 1877:

Under the present system of collecting postage on newspapers and periodical publications mailed to regular subscribers from the office of publication there has been collected during the year on this class of matter the sum of \$1,024,719 16, derived from 40,865,246 pounds, at 2 cents per pound, and 6,913,808 pounds, at 3 cents per pound. The increase in the whole amount collected over that for the preceding year was \$10,564 89, or 1.04 per cent.

Revenues from newspaper postage.

The report of Hon. A. D. Hazen, Third Assistant Postmaster-General, for the same year, says:

The system of collecting postage in advance still exhibits its advantages over the system formerly in operation. Over fourteen thousand quarterly returns, covering collections of this particular class of postage, have been made during the year by postmasters of 3,576 offices, which returns, after being carefully audited, have been entered upon the books of the division. The amount of this postage is as follows:

On 40,865,246 pounds of matter, at 2 cents per pound.....	\$817,304 92
On 6,913,808 pounds of matter, at 3 cents per pound.....	207,414 24
Total.....	<u>1,024,719 16</u>

This shows an increase over the amount collected during the preceding year of \$10,564 89, or 1.04 per cent.

Of the total amount, it will be seen from the subjoined general table that more than half was collected at only six offices:

Offices.	Pounds of newspaper and periodical matter.	Amount of postage on same.
New York.....	15,397,438	\$338,029 62
Chicago.....	3,653,202	77,915 88
Boston.....	3,082,255	66,412 40
Philadelphia.....	2,175,112	52,643 84
Saint Louis.....	2,093,503	43,797 72
Cincinnati.....	1,869,110	39,724 86
	28,270,620	618,524 32

The following extract is from the report of Postmaster-General D. M. Key, November 9, 1878:

The total revenues of the department were \$29,277,516 95, of which \$1,093,845 were for newspaper and periodical stamps.

Under the act of Congress of June 23, 1874, regarding the prepayment of postage on second-class matter mailed by publishers and news agents, the total amount of postage collected on such matter during the fiscal year was \$1,025,180 98, or \$817,673 26 on 40,883,663 pounds at 2 cents per pound, and \$270,507 72 on 6,916,924 pounds at 3 cents per pound. The increase of the amount of postage collected over that of the preceding fiscal year was \$461 82.

I renew the recommendation made in my last annual report, that suitable provision be made by law to deliver to editors free of customs duties the newspapers and other printed matter received in the mails from foreign countries when dispatched in accordance with the provisions prescribed by the universal postal union convention. The fact that our laws impose customs duties upon newspapers and other printed matter of every kind received from foreign countries causes embarrassment to this department in its relation to the other postal conventions, as well as annoyance and inconvenience to our citizens who subscribe for foreign publications or occasionally receive them from correspondents abroad. The duties chargeable on such publications, even if they could be regularly collected, are too trifling in amount to justify the expense of their collection. Restriction of this character on their free entry and circulation is not only in conflict with the stipulations of the postal conventions of other countries, but places the United States in the unenviable position of being the only country in the world whose laws exact customs duties on publications of this character received in the mails from other countries.

From the report of Postmaster-General Key, dated November 8, 1879, the following extract is taken:

The total amount of postage collected during the year on periodicals mailed to subscribers from known offices of publication was \$1,104,184 67: On 42,958,033 pounds of matter at 2 cents per pound, \$859,160 66; on 8,167,467 pounds of matter at 3 cents per pound, \$245,024 01.

The increase in the amount of postage collected during the year on this class of matter over the previous year is \$79,003 69, which, in view of the reduction in the rate on newspaper and periodical postage, which took effect the 1st of May last, under the act approved March 3, 1879, is a very gratifying increase.

The following is taken from the report of the same Postmaster-General for 1880:

The weight of newspaper and periodical matter mailed during the year from regular offices of publication or from news agencies was 61,322,629 pounds (30,661 tons), the postage on which was \$1,226,452 58. This is an increase of \$122,267 91, or 11 per cent. over the amount of postage collected on such matter during the preceding year, and is rather remarkable, considering the reduction made by the act of March 3, 1879, in the rate of postage on periodicals, which reduction went into effect only two months prior to the beginning of the present fiscal year. The number of post-offices at which this class of matter was mailed during the year is 4,423, an increase of 235, or 5.6 per cent., over the number for the preceding year. (a)

a In explanation of the excess of towns where second-class mail matter is received over the number of towns discovered by the census where newspapers or periodicals were published Mr. E. J. Dallas writes as follows:

“WASHINGTON, D. C., November 26, 1881.

“MY DEAR SIR: Your letter of the 23d instant has been received. The apparent discrepancy between the report of the department and the figures that you have obtained is explainable as follows:

“The department's report includes the number of post-offices at which second-class matter was mailed at any time during the last fiscal year, whether by publishers or news agents, the latter having, under the law, the privilege of mailing their matter at pound rates. As newspapers are being established and discontinued constantly, the number of offices at which second-class matter was mailed at any one time, for example, when the census was being taken, could not include all the offices at which it has been mailed during the entire year. You are also to understand that news agents in many instances are carrying on business within the delivery of small post-offices where newspapers are neither printed nor published, but for the purposes of the department's statistics it is necessary to include those offices in the Postmaster-General's annual report, while they would not naturally belong in yours.

“Very truly, yours,

“E. J. DALLAS.”

The following table shows the number of pounds of newspapers and periodicals mailed during the year and the amount of postage collected thereon at ten of the principal post-offices in the United States: (a)

Post-office at—	WEIGHT OF MATTER.		Postage collected.	Per cent. of total amount collected in the United States.
	In pounds.	In tons.		
New York, New York.....	17,326,455	8,663	\$346,529 10	28.2
Chicago, Illinois.....	5,775,760	2,888	115,515 20	9.4
Boston, Massachusetts.....	3,753,016	1,876	75,060 32	6.1
Philadelphia, Pennsylvania.....	3,169,614	1,585	63,392 28	5.1
Saint Louis, Missouri.....	2,697,319	1,348	53,946 38	4.4
Cincinnati, Ohio.....	2,593,799	1,297	51,875 98	4.2
Augusta, Maine.....	2,216,901	1,108	44,338 02	3.7
San Francisco, California.....	1,180,764	590	23,615 28	2.0
Louisville, Kentucky.....	763,840	382	15,276 80	1.2
Baltimore, Maryland.....	592,546	296	11,850 92	1.0
Total.....	40,070,014	20,033	801,400 28	65.3

In the year 1880 the post-office department instituted a count of the mail matter passing through the several post-offices in the several states. This count was supervised by a special committee appointed for that purpose, of which Mr. E. J. Dallas, the superintendent of the dead-letter office, was the efficient chairman. The period covered by this count was sufficiently contemporaneous with the census year to permit of comparison. It showed the following results in respect to newspapers and periodicals:

States and Territories.	SECOND-CLASS MAIL.		States and Territories.	SECOND-CLASS MAIL.	
	Number of newspapers mailed to subscribers or news agents by publishers and news agents.	Number of magazines and other periodicals mailed to subscribers or news agents by publishers and news agents.		Number of newspapers mailed to subscribers or news agents by publishers and news agents.	Number of magazines and other periodicals mailed to subscribers or news agents by publishers and news agents.
Alabama.....	4,037,332	26,700	Missouri.....	46,128,784	1,865,784
Arizona.....	838,136	3,804	Montana.....	866,268	2,652
Arkansas.....	3,606,356	23,352	Nebraska.....	8,974,524	46,548

			Total.....	812,032,000	40,148,792

a The annual report of Postmaster-General James for 1881 supplies the following statistics for the subsequent year:

"The total amount of postage collected during the year on newspapers and periodicals mailed to regular subscribers from known offices of publication, and from news agencies, at 2 cents per pound, was \$1,399,048 64, an increase of \$172,596 06, or a little over 14 per cent.

"Of the total amount derived from this source 27.65 per cent. was collected at New York, 10.01 per cent. at Chicago, 5.95 per cent. at Boston, 5.02 per cent. at Philadelphia, 4.65 per cent. at Augusta, Maine, 4.61 per cent. at Saint Louis, 3.96 per cent. at Cincinnati, 1.71 per cent. at San Francisco, 1.53 per cent. at Detroit, 1.29 per cent. at Louisville, 1.25 per cent. at Cleveland, 1.21 per cent. at Milwaukee, 1.02 per cent. at Pittsburgh, 1.01 per cent. at Toledo, and eighty-eight hundredths of one per cent. at Baltimore.

"The 15 offices named collected 71.75 per cent., or nearly three-fourths of the whole amount realized.

"The weight of second-class matter mailed was 69,952,432 pounds, or 34,976 tons. The number of post-offices at which the matter was mailed was 4,821, an increase of 390 over the number for the previous year."

By comparing these figures with those of the census giving the actual circulation of newspapers and periodicals during the census year we arrive at a definite knowledge of the proportion of the total circulation which is distributed through the agency of the United States mails. We have seen that the actual number of copies annually printed of newspapers and periodicals of all classes is 2,067,848,209. Of this number Mr. Dallas' report shows that 852,180,792, including newspapers and periodicals, were transmitted through the mails, leaving 1,215,667,417 copies to reach their destination through other agencies—the carrier, the express companies, the news agencies, and other miscellaneous methods. The great revolution which time has wrought in the methods of newspaper transmittal is well illustrated by these figures. In the early days of newspapers in this country the mails were the sole reliance of the publishers for transmission outside the city or town of publication. They are still the chief sources of circulation in other countries, although it is worthy of note that a count similar to that instituted by Mr. Dallas in this country was made in Great Britain, covering the same period of time, which showed a total of but 130,518,400 newspapers and periodicals transmitted through the British mails, a smaller number by 721,662,392 pieces than the United States mails carried in the same period of time. The significance of these figures lies in their demonstration of the fact that there is in Great Britain no such universal diffusion of the newspapers and periodicals—the periodicals especially—published in the large cities as exists in the United States. During the census year the practice of starting newspaper trains out of London at 5 a. m. was inaugurated from the four great railway termini of that city. These trains deliver the metropolitan dailies in all the large cities of England before noon, and their circulation has considerably increased in consequence.

Comparison of count with statistics of the Tenth Census.

The several methods of newspaper carriage.

CIRCULATION OUTSIDE THE MAILS.

The development of the railway system has robbed the post-office department of the larger portion of the patronage of the press, (a) publishers finding that they can transmit their papers by express to the chief centers not only cheaper, but with greater celerity than the mails can handle them. It follows that at present but a small portion of the daily newspapers of the United States, except those which are sent in exchange for other papers, are transmitted by mail.

The press outgrows the post-office.

The development of the carrier system for the distribution of daily newspapers has of course not particularly interfered with the postal revenues from the press. It is a system of delivery that may be called American in its origin, and the custom of hawking newspapers in the street is almost contemporaneous with their existence on this continent. The early publishers also hawked books and ballads in the same manner, and there were many book-peddlers in the colonial era. To-day a very considerable proportion of the circulation of our daily press, especially in the large cities, is sold in this manner by the newsboys, who buy at wholesale rates from the counting-room. This practice is almost unknown in England even at the present date. (b)

The distribution of papers by carrier is sometimes managed directly from the office of publication and sometimes let out by routes to responsible parties. Thus in New York, San Francisco, and other large cities certain well-defined routes are owned by individuals who buy the papers every morning or evening from the publishers and distribute them to their customers by carrier boys.

Much of the burden and the risk connected with the circulation of newspapers is borne by the news companies. These organizations had their beginnings in the years just previous to the civil war, when the circulation of newspapers was beginning to extend into large volume. The American News Company—or rather its nucleus—was started in New York about 1856 by A. S. Tuttle, and involved the consolidation of several of the largest newsdealing firms of that city. It established its first branch office in Chicago in 1866, called the Western News Company, and to-day it has its branches in every city in the United States. It has revolutionized the methods of newspaper circulation in the United States, performing for the publishers the larger portion of that service formerly done, at the publisher's risk, through the agency of the mails. Under the old system the publishers dealt with many dealers, large and small, direct, necessarily encountering many who were irresponsible. Now the News Company acts as a jobber, purchasing the papers from the publishers and disposing of them to the smaller dealers precisely on the principle of a mercantile commission house. It is one of the developments growing out of the extraordinary increase in the newspaper and periodical circulation of the day.

The organization of news companies.

The American News Company.

a The New York *Sun* has published figures of its relative circulation through the different channels which illustrate this fact. On a certain day in the census year its lists showed the copies delivered to news agents out of town, and buying directly of the publishers, to be 14,443; mail copies, 5,221; sold at counting-room, 792; by check to newsboys, 12,237; by ticket to the New York news companies, 101,165.—*The Paper World*.

b In Paris at least three-fourths of the entire impression of each paper is sold in the public streets. Probably five-sixths of the New York daily papers are sold in the streets, or at railways or steamboats, by newsboys and news companies. Indeed, it was proved lately, in a case which came into the courts, that out of the aggregate circulation of 11,000 copies of a particular newspaper no fewer than 8,500 were sold in the streets and at news-stands. With the London dailies it is different. The penny papers, it is true, are to be found on sale in the streets and at railroad stations, but not one-fourth of their circulation takes place in this way; while the full-priced papers—the *Times*, the *Advertiser*, and the *Post*—never sell a single copy in the streets, and but comparatively few copies at railway stations or on steamboats.—Grant, II, 421.

THE EXISTING POSTAL LAWS RELATING TO NEWSPAPERS AND PERIODICALS.

The consideration of this branch of the subject may properly be concluded with a transcript of the existing laws and the regulations of the post-office department bearing in any way upon the subject of the transmission of newspapers and periodicals through the United States mails.

The present laws and regulations regarding the transmission of newspapers and periodicals by mail.

SEC. 184. *Second-class matter*.—Mailable matter of the second class shall embrace all newspapers and other periodical publications which are issued at stated intervals, and as frequently as four times a year, and are within the conditions named in the next succeeding section. (Act March 3, 1879, §10, 20 Stat., p. 359.)

SEC. 185. *Essential characteristics of second-class matter*.—The conditions upon which a publication shall be admitted to the second class are as follows:

First. It must regularly be issued at stated intervals, as frequently as four times a year, and bear a date of issue, and be numbered consecutively.

Second. It must be issued from a known office of publication.

Third. It must be formed of printed paper sheets, without board, cloth, leather, or other substantial binding, such as distinguish printed books for preservation from periodical publications.

Fourth. It must be originated and published for the dissemination of information of a public character, or be devoted to literature, the sciences, arts, or some special industry, and have a legitimate list of subscribers: *Provided, however*, That nothing herein contained shall be so construed as to admit to the second-class rate regular publications designed primarily for advertising purposes, or for free circulation, or for circulation at nominal rates. (Act March 3, 1879, §14, 20 Stat., p. 359.)

SEC. 186. *A known office of publication defined*.—A known office of publication is a public office for the transaction of the business of the periodical, where orders may be received for subscriptions and advertising during the usual business hours. Publications issued without disclosing the office of publication must not be forwarded unless prepaid at the rate of third-class matter.

SEC. 187. *Advertising sheets defined*.—"Regular publications, designed primarily for advertising purposes," within the intendment of section 185, are defined to be—

First. Those owned and controlled by one or several individuals or business concerns, and conducted as an auxiliary, and essentially for the advancement of the main business or calling of those who own or control them.

Second. Those which, having no genuine or paid-up subscriptions, insert advertisements free, on the condition that the advertiser will pay for any number of papers which are sent to persons whose names are given to the publisher.

Third. Those which do advertising only, and whose columns are filled with long editorial puffs of firms or individuals who buy a certain number of copies for distribution.

Fourth. Pamphlets containing market quotations, and the business cards of various business houses opposite the pages containing such quotations.

SEC. 188. *Decision upon doubtful publications*.—Whenever a postmaster is in doubt as to the character of a publication offered for mailing as second-class matter, he will submit a copy of the same to the First Assistant Postmaster-General, and accompany it with a statement of such facts as he may be in possession of respecting the publication, and the reasons for his inability to decide as to its character. The First Assistant Postmaster-General will also decide any appeal from the decision of a postmaster by publishers whose publications have been excluded from the second class by the action of the postmaster.

SEC. 189. *Postmaster's record of second-class publications*.—Postmasters must keep a record of all the publications of the second class mailed at their post-offices, and submit a duplicate thereof to the office of the Third Assistant Postmaster-General, and must report on the first day of every month any changes made therein.

SEC. 190. *Postage on second-class matter*.—Publications of the second class, except as provided in section 239, when sent by the publisher thereof, and from the office of publication, including sample copies, or when sent from a news agency to actual subscribers thereto, or to other news agents, shall be entitled to transmission through the mails at 2 cents a pound, or fraction thereof, such postage to be prepaid, as now provided by law. (Act of March 3, 1879, §11, 20 Stat., p. 359.) (See section 192.)

SEC. 191. *Weighing of second-class matter*.—Periodical publications, on their receipt at the post-office of mailing, shall be weighed in bulk, and postage paid thereon by a special adhesive stamp, to be devised and furnished by the Postmaster-General, which shall be affixed to such matter, or to the sack containing the same, or upon a memorandum of such mailing, or otherwise, as the Postmaster-General may, from time to time, provide by regulations. (Act of June 23, 1874, §6, 18 Stat., p. 233.)

SEC. 192. *Manner of prepaying second-class matter*.—Publishers and news agents must tender their newspapers and periodicals intended to be sent through the mails at the post-office of mailing, so that they may be weighed in bulk. The postage thereon must then be prepaid, according to the weight of the matter to be mailed, by special adhesive stamps, known as newspaper and periodical stamps, which are furnished by the department to postmasters for that purpose. Unbound back numbers of a regular second-class publication may be sent at the rate of 2 cents per pound. (See section 159.)

SEC. 193. *"Regular subscribers" defined*.—A regular subscriber is a person who has actually paid, or undertaken to pay, a subscription price for a newspaper, magazine, or other periodical, or for whom such payment has been made, or undertaken to be made, by some other person. But in the latter case such payment must have been made or undertaken with the consent or at the request of the person to whom such newspaper, magazine, or periodical is sent. Consent is to be implied in the absence of objection by the party to whom the publication is sent.

SEC. 194. *Evidence of subscription list may be required*.—If a postmaster has reason to doubt that a publication offered for mailing as second-class matter has a legitimate list of subscribers, he may require the publisher thereof to satisfy him that it has, before permitting such publication to be mailed at the rates prescribed in section 190.

SEC. 195. *Sample copies at second-class rates*.—By section 185 subscribership is made one of the tests of the *bona fide* character of a publication. A publication having no legitimate list of subscribers cannot be admitted to the second class, except as provided in section 196. When once determined to be entitled to transmission as second-class matter, the distinction in favor of subscribership in the circulation of second-class matter, which was made necessary by former laws, is by section 190 abandoned, and sample copies of second-class publications may, when sent from an office of publication or a news agency, be forwarded in the mails at the same rates as to subscribers, to wit, at 2 cents per pound, or fraction thereof.

SEC. 196. *Admission of new publications to second-class rates*.—A temporary permit, in writing, shall be granted by a postmaster to a publication when the first issue of the same shall be presented, accompanied by an affidavit from the publisher thereof that the publication is published for the purposes named in section 185, unless the postmaster shall be satisfied from internal evidence furnished by the

publication itself that it comes within the proviso of that section. When such temporary permit shall be granted, the publication shall be entitled to pass in the mails at the rate of 2 cents per pound, or fraction thereof. Such temporary permit shall be revoked by the postmaster in case the publication shall have so changed its character as to make it no longer within the conditions named in section 185. A duplicate of such temporary permit shall be forwarded to the First Assistant Postmaster-General whenever issued.

SEC. 197. *Penalty for submitting false evidence as to a publication.*—Any person who shall submit, or cause to be submitted (for transportation in the mails), any false evidence to the postmaster relative to the character of his publication shall be deemed guilty of a misdemeanor, and upon conviction thereof in any court of competent jurisdiction shall, for every such offense, be punished by a fine of not less than one hundred dollars nor more than five hundred dollars. (Act of March 3, 1879, §13, 20 Stat., p. 359.)

SEC. 198. *Postmasters to report the submission of false evidence.*—Whenever a postmaster is of opinion that a publisher has submitted to him any false statements respecting the character of his publication, either as to its office of publication, or as to its list of subscribers, or as to any other fact which the postmaster may have deemed it his duty to ascertain in order to determine whether the publication was entitled to admission to the second class, he should report the case, with all the evidence in his possession, to the First Assistant Postmaster-General, and await his instructions.

SEC. 199. *Entry of second-class publications.*—After a publication has been determined to be of the second class, the publisher thereof may, if he desire, formally enter the same at the post-office where mailed, and print upon each copy thereof the words, "Entered at the post-office at — as second-class matter." Publications so entered, and having printed upon each copy the words of entry, may be exchanged at second-class rates with other second-class publications and may be regularly sent at second-class rates, as complimentary, to customers or business agents of the publication, and to other persons solely in the interest of the publication itself, or of its publishers or employes as such. The formal entry will consist in a written notification of the publisher's desire to the postmaster, who will forward a copy of such entry to the First Assistant Postmaster-General. The unauthorized printing by a publisher of the words of entry herein prescribed, or their equivalent, will render him liable to the penalty prescribed in section 197. Postmasters should take pains to call the attention of publishers to this section and invite them to enter their publications as herein set forth.

SEC. 200. *News agents applying for second-class rates must make and file with the postmaster at their post-office of mailing a statement signed by them showing the names of the periodicals which they thus mail, the post-offices respectively to which they are directed, and the number of such subscribers to each, with the dates to which their respective subscriptions extend. On all packages of second-class matter mailed by news agents to newsdealers the word "newsdealer" must form part of the address.*

SEC. 201. *Evidence required of news agents.*—In order to enable news agents to transmit matter of the second class at pound rates which is not published within the delivery of the post-office of mailing they must furnish evidence that the periodical so offered has been inspected and admitted to the second class by the postmaster at the post-office of publication. The most satisfactory evidence of such inspection and approval will be when, in some conspicuous portion of its title page or cover, the periodical bears the printed words of entry prescribed in section 199.

SEC. 202. *News agents defined.*—No person is a news agent within the contemplation of the law by virtue of his acting simply as a local or traveling agent for a publication. He must be engaged in business as a newsdealer or bookseller in order to be entitled to send newspapers and periodicals at the pound rates.

SEC. 203. *Sample copies defined.*—Sample copies of publications of the second class, which are entitled to transmission through the mails at two cents a pound, are defined to be copies sent to persons not subscribers, for the purpose either of inducing them to subscribe for or to advertise in the publication, or to agents, or to persons desiring to become agents, or whom the publisher may wish to induce to act as agents, to be used by them in procuring subscriptions and advertising. Any number of copies of any number of different editions of a second-class publication may be sent at any one time as sample copies. The primary design of a publisher in sending out sample copies is to increase the subscription list and advertising patronage of his publication, and the law permits him to send such copies at the most favored rates, in the expectation that the correspondence resulting therefrom, and the increased circulation of the publication to regular subscribers, will augment the postal revenues. (See section 195.)

SEC. 204. *Extra numbers not sample copies.*—Publishers will not be permitted, however, to use the exceptional advantages given to them by the law so as to defraud the postal department by mailing as sample copies extra numbers of their publications ordered by advertisers, or by campaign committees, or by other persons, to be sent to specified addresses, and apparently intended, from the nature of the contents or of marked portions thereof, to serve the business, political, or personal interests of the person or persons ordering the same. Such copies are third-class matter, and must be prepaid by stamps at the rate of one cent for each two ounces or fractional part thereof.

SEC. 205. *Sample copies to be mailed separately.*—Sample copies of second-class publications should be put up in single wrappers, and each package addressed to a person or firm should be plainly marked, in printing or writing, "sample copy."

SEC. 206. *Supplements admitted as second-class matter.*—Publishers of matter of the second class may, without subjecting it to extra postage, fold within their regular issues a supplement; but in all cases the added matter must be germane to the publication which it supplements; that is to say, matter supplied in order to complete that to which it is added or supplemented, but omitted from the regular issue for want of space, time, or greater convenience, which supplement must in every case be issued with the publication. (Act of March 3, 1879, § 16, 20 Stat., p. 359.)

SEC. 207. *Definition of supplements.*—A supplement is held to be matter proper to be inserted in the publication to which it is added, but not inserted for want of space, or want of time, or because it is more convenient regarding space or time, or either, that it should be printed on a separate sheet. It is not indispensable or necessary that the sheet should be printed at the office of the publication to which it is intended to be a supplement; but if printed there or elsewhere, to be considered or treated as a supplement, it must be printed with the intention and purpose only of supplying an integral portion of the publication to which it professes to be a supplement, and not for another distinct and separate use. It should have direct relation to the publication supplemented, so that without it the publication supplemented would be incomplete.

SEC. 208. *Hand-bills and posters not supplements.*—The two preceding sections cannot be construed to admit "hand-bills" or "posters" as supplements. Hand-bills and posters are subject to the rate of postage of one cent for each two ounces or fraction thereof; and when such matter is inclosed in a newspaper and sent to regular subscribers it subjects the package to postage at the higher rate of one cent for each two ounces. Should the package reach the post-office of delivery without any evidence of prepayment, double the prepaid rate must be charged.

SEC. 209. *Examination of second-class matter.*—Matter of the second class may be examined at the [post] office of mailing, and if found to contain matter which is subject to a higher rate of postage, such matter shall be charged with postage at the rate to which the inclosed matter is subject: *Provided*, That nothing herein contained shall be so construed as to prohibit the insertion in periodicals of advertisements attached permanently to the same. (Act of March 3, 1879, § 12, 20 Stat., p. 359.)

SEC. 210. *Prohibited advertisements in second-class matter.*—Advertisements in the form of separate sheets in the body of periodical publications, which are inserted for convenience, and for the purpose of being removed and put to separate use, are not "attached permanently" to such periodical within the meaning of the preceding section, and when so inserted will subject the periodicals in which they are found to the rate of one cent for each two ounces, or fraction thereof; but this must not be held to apply to bills, receipts, and orders for subscription to such periodicals, which are permitted by the proviso to section 233.

SEC. 211. *Detention of suspected second-class matter.*—When the postmaster at the post-office of mailing shall have reason to believe that any publisher or news agent has violated the provisions of section 209 by depositing third-class matter in any post-office, for transmission through the mails as matter of the second class, he may, at his discretion, retain the suspected matter, notifying the publisher or news agent at once of his action, and report the facts to the Postmaster-General. If such third-class matter shall by inadvertence reach its destination, the postmaster at the post-office of destination must collect the postage due thereon as prescribed by law.

SEC. 212. *Foreign publications admitted as second-class matter.*—Foreign newspapers and other periodicals of the same general character as those admitted to the second class in the United States may, under the direction of the Postmaster-General, on application of the publishers thereof or their agents, be transmitted through the mails at the same rates as if published in the United States. Nothing in this act shall be so construed as to allow the transmission through the mails of any publication which violates any copyright granted by the United States. (Act of March 3, 1879, §15, 20 Stat., p. 359.)

SEC. 213. *Examination of foreign publications.*—Agents of foreign publications, who may desire to secure the benefits of the second-class rates of postage for the transmission of such publications in the domestic mails, should make application to the postmaster at the post-office where they desire the same to be mailed, and if the postmaster is of opinion, after an examination of the publications submitted, that they are in their essential features similar to domestic publications transmitted in the mails at the second-class rates, he will, upon their complying with the provisions of section 200 and filing an affidavit that the publications submitted come within the first and second conditions of section 185, and that they have a legitimate list of subscribers in the country where they are published, admit them to the mails on the same terms as domestic publications.

SEC. 236. *Manner of presenting second-class matter for mailing.*—In mailing publications of the second class they should in all cases be properly dried, folded, and addressed. It is certainly no part of the duty of a postmaster or his assistants to fold newspapers so that they can be placed in the boxes, &c., for delivery; and in case a publisher persists in sending them without being properly folded, after being notified to put them up so that they can be promptly assorted and delivered, the postmaster would be justified in not distributing them with the regular mail.

SEC. 239. *Free county publications.*—Publications of the second class, one copy to each actual subscriber residing in the county where the same are printed, in whole or in part, and published, shall go free through the mails; but the same shall not be delivered at letter-carrier offices, or distributed by carriers, unless postage is paid thereon at the rate prescribed in section [190]: *Provided*, That the rate of postage on newspapers (excepting weeklies) and periodicals not exceeding two ounces in weight when the same are deposited in a letter-carrier office for delivery by its carriers shall be uniform at one cent each; periodicals weighing more than two ounces shall be subject, when delivered by such carriers, to a postage of two cents each, and these rates shall be prepaid by stamps affixed. (Act of March 3, 1879, §25, 20 Stat., p. 361.)

SEC. 240. *Postage on second-class matter at free-delivery post-offices.*—Mailable matter of the second class deposited in a letter-carrier post-office for local delivery shall be delivered through boxes or the general delivery on prepayment of postage at the rate of two cents per pound, but when delivered by carriers the following rates must be prepaid by postage stamps affixed: On newspapers (except weeklies), one cent each without regard to weight; on periodicals not exceeding two ounces in weight, one cent each; on periodicals exceeding two ounces in weight, two cents each. The rate on weekly newspapers of the second class deposited by the publisher in a letter-carrier post-office for local delivery is two cents per pound, whether the same are delivered by carriers or through boxes or the general delivery.

SEC. 241. *Second-class matter at free-delivery offices, how separated.*—Second-class matter for city delivery, where the carrier system is established, should be separately made up at the office of publication—that for delivery by the carriers of a post-office being put in one package or bundle, each article of mail matter therein properly stamped, and that for delivery through the boxes of the post-office by itself. If the separation is not made at the office of publication, each paper or periodical not properly stamped must be placed in the boxes or at the general delivery for delivery therefrom.

SEC. 242. *Free county publications must be mailed by themselves.*—When a publisher of a newspaper sends in the mails a package of his papers, a portion intended for subscribers residing within the county in which the paper is printed (in whole or in part) and published, and the remainder intended for subscribers residing in another county, he must pay postage on the entire package at the pound rates. The publisher should make two packages, one for the subscribers residing in the county and one for those out of the county, the former to go free under section 239.

SEC. 243. *Publications with offices in two counties free in neither.*—No publication of the second class claiming more than one office of publication in different counties is entitled to pass in the mails free in either county unless the publisher elect which office he will regard as his office of publication. In that event the publication shall go free in that county only. The postmaster at the post-office thus selected should notify the postmaster at the other post-office of such selection. The provisions of this section are not applicable, however, to publications claiming or having more than one office of publication which do not claim free county circulation.

SEC. 244. *Sample copies of free county publications subject to postage.*—Nothing in the act of March 3, 1879, can be so construed as to permit "sample copies" of any publication to be mailed free in the county where the same is printed or published; they must be prepaid at the rate of two cents for each pound.

NEWSPAPER FILES.

At the suggestion of the Superintendent, a request was sent with the press schedules to the publishers of the newspapers of every class for a specimen copy of the journal, for which a franked wrapper was inclosed, with a view to making a complete collection of the issues of the periodical press of the census year for permanent preservation in the Congressional Library. A very general response was made to this request, and all publications not found in the file at the conclusion of the inquiry were again sent for, and were, with hardly an exception, received. The publishers were asked to send the issue of their publication nearest in date to July 4, 1880, and, with some exceptions among journals received in response to the last request, the file represents the press of the United States as it stood on the national anniversary in the census year. The specimen journals, as they were received, were checked and filed, with respect to newspapers,

The census file of newspapers and periodicals.

alphabetically by towns and cities of publication in the several states, and as the file for each state was completed the papers were deposited in portfolios, and the collection passed into the custody of the Librarian of Congress. The periodical press, including the magazines, trade and professional journals, etc., was arranged in groups, the law journals, the medical journals, the scientific journals, the literary journals, etc., each forming a group by themselves, and each arranged by states.

A similar effort was made at the census of 1850 to form a file of the newspaper press of the United States as it then existed. (a) The Superintendent of that Census, in his report, spoke of this effort as follows:

An effort was made to secure at least one copy of every journal published in the United States in 1850, and the assistant marshals were intrusted with the matter. It has been attended to but partially, and the papers obtained fall very far short of the actual number returned by name. This is to be regretted, as such a file, complete in every respect, properly bound and placed away in the Library of Congress, would be a great national curiosity, and be of great interest to the future antiquarian.

No such criticism can be made respecting the file of the American press which the Tenth Census contributes to the literary archives of the nation. It is felt that all the value assigned by Superintendent De Bow, and much more, attaches to this file. It conveys a much more vivid picture of the actual character, typographical, literary, mechanical, intellectual, and moral, of the press of to-day than can be conveyed by a report, and supplies a more complete understanding of the immense development of the press than can be pictured by cold statistics. It admits of ready comparison between the press of all the states and the journals of all classes and descriptions. In comparison with a similar file, made ten or twenty years hence, it will offer a more exact standard for measuring the degree and the nature of the progress of the intervening years than any figures can afford.

In this connection, it is proper to add that there has been, and still continues to be, in every American state a failure to appreciate the importance of preserving files of the newspapers of each locality. The newspaper in itself is of necessity a matter of transient interest. It appears, it serves its purpose, ^{The importance of preserving newspaper files.} it is superseded by another of later date, and ceases to be regarded as of importance or value; but there is no issue of the humblest paper in all the land in which there does not appear something which will some time prove of real historic value. The newspaper, of necessity, bears an intimate relation to the official history of the corporation in which it is published. Whether or not it be designated as the repository of the official proceedings of the corporate authorities, it nevertheless contains them, and thus becomes a method of record which, in point of regularity and fullness, is unsurpassed. The historians of the colonial era find no better clew to the feeling, the events, and the character of those times, or of the personages who figured in them, than is contained in the files of the newspapers then published, and it is their constant source of grievance and annoyance that they are not only few in number and difficult of access, but are far from complete. Even in later days files of newspapers which in their time were repositories of the current history of important localities, and which exercised a marked influence upon public opinion, are few in number and imperfectly preserved. Hundreds of newspapers have been born, have lived a brief space, and chronicled their share of history, yet no trace of them remains anywhere. Such files as we now possess of the journals of the past are due almost entirely to private appreciation of their value as the sources out of which history is to be wrought. They are in the possession of historical societies and private individuals, and are prized among the choicest of their collections. All told, they do not represent one tithe of the actual publications which have emanated from the American press. I can learn of no town, city, or county which makes it one of the duties of its officers to preserve files of the newspaper press of the locality, and there is no state which keeps a regular file of the ^{The official preservation of newspaper files.} newspapers printed within its limits and regularly supplying the most complete record of its history attainable. (b) Not even the newspapers themselves are as careful in the matter of files as pride and self-

a The first known attempt to make a file of American newspapers was that of the late Joel Munsell, of Albany, New York—a gentleman who did as much as any man who ever lived in this country to advance and promote the art of typography and to preserve its annals—in 1828. The papers in Mr. Munsell's files were generally single specimens, the first issues, where they could be obtained, or copies that contained something of more than ordinary interest. Taken as a whole, the collection satisfactorily illustrated the character and condition of the American press at the time. It was bound in 100 volumes, which are now deposited in the New York state library.

b The Maine legislature, at its session in 1849, directed the clerks of the county courts to purchase, bind, and preserve, for the use and at the expense of the county, a copy of the newspapers published therein, not to exceed three in number, commencing with the year 1849, and giving preference to those papers abounding in historical and other information valuable to the public.—Munsell's *Typographical Miscellany*.

While no one library, however large and comprehensive, has either the space or the means to accumulate a tithe of the periodicals that swarm from a productive press, there are valid reasons why more attention should be paid by librarians to the careful preservation of a wise selection of all this current literature. The modern newspaper and other periodical publications afford the truest, the fullest, and on the whole the most impartial image of the age we live in that can be derived from any single source. Taken together, they afford the richest material for the historian or the student of politics, of society, of literature, and of civilization in its various aspects. What precious memorials of the day even the advertisements and brief paragraphs of the newspapers of a century ago afford us! While in a field so vast it is impossible for any one library to be more than a gleaner, no such institution can afford to neglect the collection and preservation of at least some of the more important newspapers from year to year. A public library is not for one generation only, but it is for all time. Opportunities once neglected of securing the current periodicals of any age in continuous and complete form seldom or never occur. The principle of selection will, of course, vary in different libraries and localities. While the safest general rule is to secure the best and most representative of all the journals, reviews, and magazines within the limits of the fund which can be devoted to that purpose, there is another principle which should largely guide the selection. In each locality it should be one leading object of the

interest would seem to require. There are many of the long established newspapers which have no complete files of their publication. The accident of fire frequently destroys the file accumulations of years, and as a rule they cannot be duplicated, and the frequent changes in the proprietorship of newspapers is apt to lead to a break in the files. All these contingencies serve to emphasize the importance of the suggestion that the local and the state authorities of the United States should take the steps necessary for permanently and completely preserving the newspaper records of their several sections.

CONCLUSION.

I have now concluded this report on the past history and development and the present condition and statistics of the newspaper and periodical press of the United States.

Conclusion.

The review of a progress so remarkable, and in some respects so unique as this has proved to be, might be accompanied by some attempt to estimate the influence of the newspaper press upon the commerce, the society, the politics, the morals, the education, and the happiness of the people. I have preferred, however, to leave deductions of that character to others, who may find herein the materials upon which to found them. The American press has been the recipient of much eulogy, and much condemnation as well, at the hands of many whose words are entitled to respectful consideration. To both those who eulogize and those who condemn it must present itself, in the light of the statistics which form the basis of this report, as a factor in our civilization which is unsurpassed by any other in the energy, the enterprise, and the success of those who are engaged in its conduct. The earnings of the newspaper press represent a large portion of the wealth which the census of 1880 reveals in the United States. The men and women employed in it, both mechanically and professionally, are no mean proportion of our citizenship, and their rate of earnings is not inferior to that of any class of laborers, either mechanical or professional. The rate of increase, both in the number and the circulation of the newspapers, is perhaps the most remarkable of any revealed in the Tenth Census. The relations of the press to the public, in the character of a servitor and assistant, are sufficiently indicated, not

principal library to gather within its walls the fullest representation possible of the literature relating to its own state and neighborhood. In every city and large town the local journals and other periodicals should form an indispensable part of a public library collection. Where the means are wanting to purchase these, the proprietors will frequently furnish them free of expense for public use; but no occasion should be lost of securing, immediately on its issue from the press, every publication, large or small, which relates to the local history or interests of the place where the library is maintained. This collection should embrace not only newspapers, magazines, etc., but a complete collection of all casual pamphlets, reports of municipal governments, with their subdivisions, reports of charitable or benevolent societies, schools, etc., and even the prospectuses, bulletins, catalogues, etc., of real-estate agents and tradesmen. Every library should have its scrap-books (or series of them) for preserving the political broadsides and fugitive pieces of the day which in any way reflect or illustrate the spirit of the times or the condition of the people. These unconsidered trifles, commonly swept out and thrown away as worthless, if carefully preserved and handed down to the future, will be found to form precious memorials of a bygone age.

While the files of the journals of any period furnish unquestionably the best instruments for the history of that epoch, it is lamentable to reflect that so little care has ever been taken to preserve a fair representation of those of any age. The destiny of nearly all newspapers is swift destruction; and even those which are preserved commonly survive in a provokingly fragmentary state. The obvious causes of the rapid disappearance of periodical literature are its great volume, necessarily increasing with every year the difficulty of lodging the files of any long period in our narrow apartments, and the continual demand for paper for the uses of trade. To these must be added the great cost of binding files of journals, increasing in the direct ratio of the size of the volumes. As so formidable an expense can be incurred by very few private subscribers to periodicals, it is so much the more important that the public libraries should not neglect a duty which they owe to their generation as well as to those that are to follow. These poor journals of to-day, which everybody is ready to stigmatize as trash not worth the room to store or the money to bind, are the very materials which the man of the future will search for with eagerness, and for some of which he will be ready to pay their weight in gold. These representatives of the commercial, industrial, inventive, social, literary, political, moral, and religious life of the times should be preserved and handed down to posterity with sedulous care. No historian or other writer on any subject who would write conscientiously or with full information can afford to neglect this fruitful mine of the journals, where his richest materials are frequently to be found.

The life-long devotion of a late American collector, Peter Force, of Washington, to the same historical spirit resulted in amassing a large and rich library of manuscripts, newspapers, books, pamphlets, maps, broadsides, etc., mainly illustrative of American history. This invaluable collection, which no amount of money could have reassembled, was fortunately not permitted to be scattered, but was secured during the lifetime of the possessor for the Library of the United States.

In the absence of a great library of journals, or of that universal library which every nation should possess, it becomes the more important to assemble in the various local libraries all those ephemeral publications which, if not thus preserved contemporaneously with their issue, will disappear utterly and elude the search of future historical inquirers. And that library which shall the most sedulously gather and preserve such fugitive memorials of the life of the people among which it is situated will be found to have best subverted its purpose to the succeeding generations of men.

Not less important than the preservation of newspapers is that of reviews and magazines. In fact, the latter are almost universally reckoned as far more important than the more fugitive literature of the daily and weekly press. Though inferior to the journals as historical and statistical materials, reviews and magazines supply the largest fund of discussion upon such topics of scientific, social, literary, and religious interest as occupy the public mind during the time in which they appear. More and more the best thought of the times gets reflected in the pages of this portion of the periodical press. No investigator in any department can afford to overlook the rich stores contributed to thought in reviews and magazines. These articles are commonly more condensed and full of matter than the average books of the period. While every library, therefore, should possess for the current use and ultimate reference of its readers a selection of the best, as large as its means will permit, a great and comprehensive library, in order to be representative of the national literature, should possess them all.—Hon. A. R. Spofford, Librarian of Congress.

only by the official connection which newspapers bear to state, municipal, and other public corporations, but by the quickness and the accuracy with which they supply private individuals with the information upon which their own private concerns are dependent; and their value as conservators of historical material is put beyond dispute by the records of history itself. Their potency as an educating and informing medium is conceded by the preachers, teachers, politicians, and philanthropists who seek their agency as affording a wider method of intercommunication than any other agency of civilization. As all these multiform public functions come to be more widely understood by both public and publishers to reside in the press, its tone and character and influence cannot fail to improve and increase in a degree that shall correspond more nearly than now with its numerical and material increase of the American press. Its development has been traced through three distinct eras of progress in the history of this country, each succeeding era indicating extraordinary advancement over the one just previous. Nevertheless, the newspaper press of the United States must still be described as in the formative state. It has but reached the point where its possibilities are within the grasp of realization. In the future its progress promises to be rapid and upon a constantly broadening basis. No field of American industry and energy, combined with American intelligence and the national spirit, opens to those who embrace it more glorious opportunities.

APPENDIX A.

STATISTICAL TABLES.

APPENDIX A.

SUBJECT-MATTER OF THE STATISTICAL TABLES.

Table I is a statement of the total number of newspapers and periodicals published in the United States during the census year, grouped first by periods of issue, and second by classes or characteristics, and enumerating separately the number published in English and in other languages.

Table II is a statement showing the average and the aggregate circulation per issue of newspapers and periodicals, by states and territories, for daily newspapers, weekly newspapers connected with dailies, weeklies not connected with dailies, and all other than monthlies, and also for monthly publications; showing the aggregate number of copies of the same issued or printed during the census year, and also the average subscription price of daily newspapers, of weekly newspapers connected with dailies, and of all others.

Table III is a further analysis of the circulation per issue of newspapers and periodicals by the volume of individual circulation, classified as before by periods of issue. The entire press of the United States is here arranged in nine groups, indicating, respectively: (1) the number of journals in each state and territory with a circulation of 50,000 copies per issue and over; (2) with a circulation of 25,000 and under 50,000; (3) with a circulation of 15,000 and under 25,000; (4) with a circulation of 10,000 and under 15,000; (5) with a circulation of 5,000 and under 10,000; (6) with a circulation of 3,000 and under 5,000; (7) with a circulation of 1,000 and under 3,000; (8) with a circulation of 500 and under 1,000; and (9) the number of journals having a circulation of less than 500. Each of these nine groups is arranged by periods of issue.

Table IV is an exhibit of the amount paid annually in wages and the total gross value of the annual product, in dollars, of all the newspapers and periodicals published in the United States, by states and territories, with the percentage of total wages paid by daily newspapers, the percentage paid by weekly newspapers and all other periodicals, and the average wages paid by each establishment, shown by dailies and by weeklies and all other periodicals. This table also exhibits the percentage of receipts from advertisements and subscriptions or sales by the dailies, weeklies, and all other periodicals. It also exhibits the number of hands employed, male and female, in the manufacture of newspapers and periodicals, and the number of persons employed in editorial work.

Table V is an exhibit of the average ems of type set per issue by the daily newspapers of the several states and territories, and also by the weekly newspapers and periodicals of all descriptions, followed by the aggregate number of ems per issue set by both classes of publications. These statistics are accompanied by an exhibit of the aggregate number of pounds of type used by all the newspapers and periodicals, the number of presses owned and used in newspaper manufacture, and with the number driven by steam-, water-, and hand-power, respectively. The table concludes with an exhibit of the number of papers printed on the co-operative plan in each of the states and territories.

Table VI is an exhibit of the amount of printing paper consumed by the newspaper and periodical press of the several states and territories in the census year, calculated both in pounds and reams, showing also the average and aggregate amount of paper consumed per issue by the daily, weekly, and the periodical press, and also the aggregate amount consumed by the entire press, in the year, calculated in pounds and reams.

Table VII indicates the total number of daily and weekly newspapers and periodicals, of all periods of issue, which were established and suspended during the course of the census year. It also shows the number of consolidations or *mergers* which are represented in existing newspapers and periodicals, and the number of existing journals of all classes and kinds which were established in the decade between 1870 and 1880, the number established between 1860 and 1870, the number established between 1850 and 1860, and the number established prior to the year 1850.

Table VIII exhibits in complete shape the statistics of the various newspapers and periodicals published in the German language in the United States.

Table IX makes a similar exhibit of the statistics of the newspapers and periodicals published in the Bohemian, Catalan, Chinese, Danish and Scandinavian, French, Dutch, Indian, Irish, Italian, Polish, Portuguese, Spanish, and Welsh languages in the United States.

Table X is an exhibit, by states and territories, of the religious press of the United States, classified by twenty-five denominations and as unsectarian.

Table XI is a comparative exhibit of the leading statistics of the newspaper press of the United States as elicited by the four Federal censuses of 1850, 1860, 1870, and 1880. This table first shows the number of papers of all classes in existence at each census, their aggregate circulation per issue, and the number of copies annually printed. It then presents the same line of statistics upon a division of the newspaper press into classes by periods of issue at the four censuses, the number, the aggregate circulation per issue, and the copies annually printed of dailies, tri-weeklies, semi-weeklies, weeklies, bi-weeklies, semi-monthlies, monthlies, bi-monthlies, and quarterlies for 1850, 1860, 1870, and 1880.

Table XII is a comparison of the number of newspapers and periodicals published, and their aggregate circulation per issue, with the area in square miles and the population of the several states and territories, as shown by the Tenth Census. The areas here given are the land surface in each case. The table exhibits the average number of inhabitants to the aggregate circulation per issue and the average area in square miles for each publication in the several states and territories.

Table XIII is an attempt to localize the American press, by showing, first, the number of counties in each state and territory in which newspapers are published, compared with the actual number of towns; and, second, the number of cities, towns, and villages, in each state and territory, in which one paper is published, the number in which two are published, the number in which three are published, the number in which four are published, and the number in which five or more papers or periodicals are published.

Table XIV is a statement showing the language and number of daily, weekly, and all other newspapers and periodicals published in the several states and territories in the United States during the census year.

Table XV and last is an exhibit of the press statistics of the cities of Baltimore, Boston, Chicago, Cincinnati, Louisville, New Orleans, New York, Philadelphia, Saint Louis, and San Francisco, being the ten cities in which the press, both newspaper and periodical, had attained its most remarkable development in the census year.

NEWSPAPER PRESS OF THE UNITED STATES.

CHRONOLOGICAL HISTORY OF THE NEWSPAPER PRESS OF THE UNITED STATES.

It is not pretended that the following chronology of the early history of the newspaper press in the several states is complete, but simply that it approximates completeness more nearly than any previous publication, and therefore forms the starting point for a comprehensive chronology of the press. Not even a skeleton chronology is here supplied of the press in the states of Colorado, Florida, Mississippi, Nebraska, Nevada, Oregon, or West Virginia; and in several other states, notably those of New England, the dates are conspicuously scant and unsatisfactory. At the same time, the student of these pages will observe that in the accompanying catalogue of the American periodical press as it existed in the census year a great number of additional dates are given which it was not deemed necessary to duplicate in this chronology, but which wholly supply its deficiencies so far as they relate to publications which continued to be in existence in 1880. The catalogue and the chronology must therefore be taken together. Efforts were made in each of the states above named to obtain the outline history of the newspaper press, but without success. Undoubtedly the data exist for supplying this deficiency, in part at least. The importance of the information, as constituting the necessary basis of the permanent history of the American press, will not be disputed; and the special agent making this report will be glad to receive at his home in Utica, New York, any communications supplying missing links in this chronology, or correcting errors that may appear herein.

ALABAMA.

Area, 51,540 square miles; population, 1,262,505; 66 counties—newspapers published in 55. The total number of newspapers and periodicals published in 1840 was 28; in 1850, 60; 1860, 96; 1870, 89; 1880, 125. The publications during 1880 were divided, according to periods of issue, as follows: Dailies, 6; weeklies, 109; tri-weeklies, 1; monthlies, 7; semi-monthlies, 2. In each of 37 towns one paper was published; in 20, two; in 5, three; in 2, four; and in 4, five or more.

EARLY HISTORY.

1812.—Printing was introduced at Huntsville. The following comprise a portion of the early newspapers. (a) No records have been preserved, and in consequence but little information can be obtained:

1812.—The *Madison Gazette*, established at Huntsville.

1814.—The *Halcyon*, at Saint Stephens.

1814, February.—————, at Mobile, by George Childs (French and English).

1815.—The *Advocate*, at Huntsville. Still published.

1816, November.—The *Mobile Gazette and General Advertiser*, at Mobile.

1818.—The *Tuscaloosa Republican*, at Tuscaloosa, by T. M. Davenport.

1819.—The *Gazette*, at Florence.

1820.—The *Clarion*, at Claiborne.

1820.—The *Free Press*, at Cahaba.

1820.—The *Alabama Watchman*, at Cahaba.

1820.—The *Republic*, at Montgomery, by J. Bottelle.

1821.—The *Register*, at Mobile.

1827.—The *Advertiser*, at Moulton.

1842.—The *Ledger*, daily, by John Forsyth.

a Prepared by Walter Guild, secretary State Historical Society.

ARKANSAS.

Area, 53,045 square miles; population, 802,525; 74 counties—newspapers published in 61. The total number of newspapers and periodicals in 1840 was 9; in 1850, 9; 1860, 37; 1870, 56; 1880, 117. The publications during 1880 were divided, according to periods of issue, as follows: Dailies, 6; weeklies, 104; semi-weeklies, 1; monthlies, 2; semi-monthlies, 4. In each of 51 towns one paper was published; in 15, two; in 3, three; in 3, four; and in 2, five or more.

EARLY HISTORY.

William E. Woodruff, born on Long Island, went to Arkansas in 1819, the same year in which it was erected into a territory, and settled at Arkansas Post, then the site of the territorial government. On

November 20, of that year, he issued here the first number of the *Arkansas Gazette*, with an edition of less than one hundred. This paper was the first printed in Arkansas, the fifth started west of the Mississippi river and the oldest one published continuously under the same name. There were then two newspapers at Saint Louis, one at Cape Girardeau, one at Natchitoches, Louisiana, and one for a short time at Nacogdoches, Texas. The *Arkansas Gazette*, the *Western Methodist*, also of Little Rock, the *Van Buren Press*, the *Des Arc Citizen*, and the *Jacksonport Herald* are the only Arkansas newspapers enumerated in the accompanying catalogue which claim an origin previous to the war. That event wiped out of existence the great body of the newspapers in this as well as other southern states, and the journals established subsequently are as a rule not older than the decade.

CALIFORNIA.

Area, 155,980 square miles; population, 864,694; 52 counties—newspapers published in all. The total number of newspapers and periodicals published in 1850 was 7; in 1860, 121; 1870, 201; 1880, 361. The publications during 1880 were divided, according to periods of issue, as follows: Dailies, 58; weeklies, 250; semi-weeklies, 11; tri-weeklies, 2; monthlies, 32; semi-monthlies, 6; quarterlies, 2. In each of 56 towns one paper was published; in 29, two; in 5, three; in 7, four; and in 12, five or more.

EARLY HISTORY.

1846.—Printing was introduced at Monterey. A few of the earlier newspapers are enumerated as follows:

1846, August 15.—The *Californian*, established at Monterey, by Calton & Semple. Printed in quarto form, two columns to a page.

1847, January 9.—The *Star*, at San Francisco, by Samuel Brannan.

January 3, 1849, consolidated with the *Monterey Californian* and called the *Alta California*. Daily established in 1850. Still published.

1850.—The *Sacramento Tribune*, at Sacramento. Published a short time.

1850.—The *Daily Index*, at Sacramento, by Pickering & Lawrence. Published a short time.

1850.—The *Placer Times*, at Sacramento.

1851, April 21.—The *Nevada Journal*, at Nevada City, by W. B. Ewer. Suspended in 1861, but revived soon after and published a year and a half.

1853, September.—*Young America*, at Nevada City. Soon after changed to the *Nevada Democrat*. Suspended in 1863.

1853, September.—The *Telegraph*, at Grass Valley, by Oliver & Moore. In 1861 changed to the *Grass Valley National*. Suspended in 1870.

1865, January 16.—The *Dramatic Chronicle*, at San Francisco, by Charles de Young, changed to the *Chronicle* in 1868. Still published.

CONNECTICUT.

Area, 4,845 square miles; population, 622,700; 8 counties—newspapers published in all. The total number of newspapers and periodicals published in 1810 was 11; in 1818, 13; 1840, 33; 1850, 46; 1860, 55; 1870, 71; 1880, 139. The publications during 1880 were divided, according to periods of issue, as follows: Dailies, 17; weeklies, 99; semi-weeklies, 2; monthlies, 15; semi-monthlies, 2; tri-monthlies, 1; bi-monthlies, 1; quarterlies, 2. In each of 30 towns one paper was published; in 9, two; in 3, three; in 4, four; and in 5, five or more.

EARLY HISTORY.

1709.—Printing was introduced at New London. The following papers are among those first established: (a)

1755, January 1.—The *Connecticut Gazette*, established at New Haven, by James Parker & Co.; half sheet foolscap, 8½ by 14 inches. Publication suspended February 19, 1768.

1758, August 8.—The *New London Summary*, at New London, by Timothy Green, jr.; small half sheet. Publication suspended in 1763.

1763, November 1.—The *New London Gazette*, at New London, by Timothy Green; foolscap sheet, 14 by 17 inches. In 1773 changed to the *Connecticut Gazette*. Publication suspended in 1844.

1764, December.—The *Connecticut Courant*, at Hartford, by Thomas Green; cap sheet, 14 by 17 inches. Still published daily and weekly.

1767, October.—The *Connecticut Journal and New Haven Post Boy*, by T. & S. Green; cap sheet, 14 by 17 inches. Latter part of title afterward dropped. Publication suspended in 1835.

1773, October.—The *Norwich Packet*, at Norwich, by Robertson & Trumbull; crown sheet, 15 by 19 inches. Publication suspended in 1804.

^a Compiled from an address by J. F. Babcock, of New Haven, delivered at Middletown June 20, 1855.

1784.—The *Connecticut Gazette*, at New Haven. Published two years.

1784.—The *Litchfield Monitor*, at Litchfield, by Thomas Collier. Succeeded in 1804 by the *Litchfield Gazette*, by Hosmer & Goodwin.

1790.—The *Connecticut Gazette*, at New Haven. Published one year.

1796.—The *Federal Gazetteer*, at New Haven.

1809.—The *Connecticut Mirror*, at Hartford.

The following papers were published on the site of the *Daily Courant*, printed at Hartford:

1831.—The *Hartford Courier*, at Hartford. Succeeded in 1856 by the *National American*.

1835.—The *Patriot and Democrat*. In 1840 merged with the *State Eagle* and called the *Patriot and Eagle*. Suspended in 1842.

1836.—The *Connecticut Observer*. Succeeded in 1841 by the *Religious Herald*. Still published.

1836.—The *Christian Freeman*. Soon merged in the *Charter Oak*. Afterward merged in the *Republican*, and this in 1856 was absorbed in the *Press*, daily and weekly. In 1867 consolidated with the *Courant*.

1839.—The *Northern Watchman*. In 1839 merged with the *Congregationalist*, and this, in 1842, was sold to the *Boston Puritan*.

1843.—The *Evening Journal*, daily. In 1845 merged with the *Courant*.

1845.—The *Nonpareil* (literary). Suspended in 1847.

1846.—The *New England Weekly Review*. In 1847 changed to the *Connecticut Whig*. In 1849 merged with the *Courant*.

1846.—The *Fountain* (temperance). Suspended in 1855.

1850.—The *Advent Watchman*. Suspended about 1856.

1857.—The *Calendar* (Episcopal). In 1865 changed to the *Churchman* and removed to New York, where it is still published.

DELAWARE.

Area, 1,960 square miles; population, 146,608; 3 counties—newspapers published in all. The total number of newspapers and periodicals published in 1810 was 2; in 1840, 6; 1850, 10; 1860, 14; 1870, 17; 1880, 26. The publications during 1880 were divided, according to periods of issue, as follows: Dailies, 5; weeklies, 20; monthlies, 1. In each of 6 towns one paper was published; in 3, two; and in 1, five or more.

EARLY HISTORY.

1762.—Printing was introduced at Wilmington.

1762.—The *Wilmington Courant*, established at Wilmington, by James Adams. Published six months.

1784.—The *Wilmington Gazette*, established as a weekly. Is now published daily and weekly.

1787.—The *Wilmington Courant*, at Wilmington, by James Adams. Published two or three years.

1838.—The *Delaware Register* (monthly), at Dover, by William Huf-finton.

DISTRICT OF COLUMBIA.

Area, 60 square miles; population, 177,624. The total number of newspapers and periodicals published in 1810 was 6; in 1840, 14; 1850, 18; 1860, 13; 1870, 22; 1880, 44. The publications during 1880 were divided, according to periods of issue, as follows: Dailies, 5; weeklies, 23; monthlies, 15; quarterlies, 1.

EARLY HISTORY.

1796, June 11.—The *Washington Gazette*, established at Washington, by Benjamin Moore; semi-weekly.

1800.—The *Washington Federalist*.

1800, October 31.—The *National Intelligencer and Washington Adver-*

DISTRICT OF COLUMBIA—Continued.

tiser, by Samuel H. Smith, tri-weekly, as the organ of Jefferson's administration. Joseph Gales, jr., became one of the publishers in 1810, and in 1812 William W. Seaton joined the firm, which was known as Gales & Seaton. Suspended publication in 1866.

1822.—The *National Journal*, by Thomas L. McKinney; in 1825 it was owned and edited by Peter Force.

1826.—The *United States Telegraph*, by Duff Green, as the organ of President Jackson's administration.

1830, December.—The *Globe*, by Francis P. Blair, superseded the *Telegraph* as the organ of the administration of Jackson. In 1845 its appurtenances passed to the *Union*, but the *Globe*, thereafter known as the *Congressional Globe*, became the publisher of the official debates, under a contract awarded to Blair & Rives in 1846. Now the *Congressional Record*, published by Congress.

1834.—The *Washington Mirror*. Merged in the *Telegraph* in 1836.

1836.—The *Reformation*, by Duff Green. Succeeded by the *Chronicle* in 1838.

1841.—The *Independent*, by Edward N. Johnston, Joseph Segar, and J. H. Pleasants.

1842.—The *Madisonian*, edited first by Thomas Allen, then by John Jones; the organ of President Tyler.

1845.—The *Union*, by Thomas Ritchie and John P. Heiss.

There were five papers published at Washington in this year: the *Union*, the *Constitution*, the *United States Journal*, the *Globe*, and the *National Intelligencer*.

1846.—The *Daily Times*, by H. H. Robinson, succeeding the *United States Journal*.

1847.—The *National Era*, by Dr. Gamaliel Bailey, as the organ of the anti-Slavery party.

1848.—The *Republic*.

1853.—The *Star*, by Charles W. Denison, afterward owned and edited by W. D. Wallach; now published by the *Star Publishing Company*.

GEORGIA.

Area, 58,980 square miles; population, 1,542,180; 137 counties—newspapers published in 100. The total number of newspapers and periodicals published in 1810 was 13; in 1840, 34; 1850, 51; 1860, 105; 1870, 110; 1880, 200. The publications during 1880 were divided, according to periods of issue, as follows: Dailies, 16; weeklies, 163; semi-weeklies, 3; tri-weeklies, 4; monthlies, 11; semi-monthlies, 3. In each of 75 towns one paper was published; in 17, two; in 8, three; in 2, four; and in 6, five or more.

EARLY HISTORY.

1762.—Printing was introduced at Savannah.

1763, April 17.—The *Georgia Gazette*, established at Savannah, by James Johnston; cap sheet, 14 by 17 inches. Publication suspended after 1802.

1785.—The *Augusta Chronicle*, at Augusta, by J. E. Smith. Afterward consolidated with the *Constitutionalist* and called the *Chronicle and Constitutionalist*. Still published, daily, tri-weekly, and weekly.

1798.—The *Savannah Republican*, at Savannah, by Lyon & Morse. Suspended after 1829.

MAINE.

Area, 29,895 square miles; population, 648,936; 16 counties—newspapers published in all. The total number of newspapers and periodicals published in 1810 was 8; in 1840, 36; 1850, 49; 1860, 70; 1870, 65; 1880, 123. The publications during 1880 were divided, according to periods of issue, as follows: Dailies, 12; weeklies, 90; tri-weeklies, 1; bi-weeklies, 1; monthlies, 18; quarterlies, 1. In each of 35 towns one

paper was published; in 11, two; in 2, three; in 1, four; and in 5, five or more.

EARLY HISTORY.

1780.—Printing introduced.

1785, January 1.—The *Falmouth Gazette and Weekly Advertiser*, established at Bangor, by Titcomb & White. See Cumberland county. (a)

a It was said in 1842 that the man was yet living who published the first paper in Maine, fifty-six years before. It was about the size of a sheet of foolscap, and made up of extracts from other papers, a fortnight and three weeks old, from New York and Boston, as the latest intelligence. Thomas has no allusion to this paper. We learn that a paper was established at Falmouth about the year 1785, the object of which was to advocate the separation of the province from Massachusetts and erect it into an independent state. The expenses of the government in such case were estimated at £3,500, which, if raised by poll-tax, would amount to 6s. on a poll. It was probably the paper above mentioned.—*Munsell's Typographical Miscellany*.

MAINE—Continued.

The following is a list of the early publications by counties:

ANDROSCOGGIN COUNTY.

1847, May 21.—The *Lewiston Journal*, at Lewiston, by William H. Waldron & Co. April 20, 1861, daily *Journal*, established in connection with weekly. Still published.
